Last-modified: January 9, 1999

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

I should still have some scans of an old electronics magazine article on
a composite to RGB convertor I can send you. I cannot recall offhand
which chip it is centered around, but it may be of help. If you are
interested, the scans are in GIF format (never got around to OCR'ing them
and correcting the result), and I could either send them as an e-mail
attachment, or post them to my web page.

I loved those sounds, it made it seem as if the Atari was computing this
huge ammt. of data (which it technically was but you know what I mean).
It always reminded me of galloping horses.

I always liked the XF551 as far as it's sleek design, speed, and
quietness....WHEN IT WORKED! That damn disk drive never works right.
Always has load errors. I liked it because I could have the 1050s w/
the 800XLs and the XF551 w/ my XEs, HOWEVER, I had to get one of my
trusty 1050s instead because of that drives unreliablilty.

Is it just me, or does everyone who owns one have similar probs. w/ it?

Well, a big problem with those XF-551's are the SIO cable connector. The soldering was a shit job. I have had little trouble after I soldered the PCB myself. And I even like it better than my DTI 1050, which runs 5x faster than standard SIO and copies disks. That's unreliable loading copy protected programs.

Do the soldering and you might get rid of the problem. Depends on load error you get of course, but I usually got a humming noise, like when a tape fails to load and the SIO initializes or something. Push the cable and if it continues loading, it's probably the SIO connector

Take Atarian care and have an Atarian day

: of
: >BBS software and it freezes completely and halts the Amis BBS software.

: With the RT8 you get the wrong day because the old TDLINE wasn't Y2K complient.
: This is changed in the new version that came with Sparta 3.2g. Now you have no
: problems untill 2083. Which makes me believe it uses some kind of reference

Also, there is a fudge to get around the Y2K problem in the old TDLINE.

TDLINE used to use an offset from 1900. Although you cannot type 01/01/100
as the year you can get away with 01/01/:0 and it produces the correct
date.

This is because '9' + 1 = ':' and TDLINE didn't trap that. it just did
something like yr = asc(td$(7,2)) or something..

Well, Mac/65 was released in a disk version, and also DDT was released
in a disk form as Extended DDT (which is more powerful than DDT). Get
both of those. Or try Bug/65 cuz it ain't bad. EXDDT is best though.

I doubt the 8-bit atari's could do better graphics than the Commodore 128 - thousands of apparent colors on the screen at the same time and at a 640 by 400 screen resolution, indeed full use of the 64k video ram for video information alone.

In fairness, however, very few titles took advantage of the VDC. Commodore's
fault for not documenting it well, or allowing BASIC 7.0 to use it.

Hope y'all can help me out here. After reading several posts about this over the last few months, I would like to try to pull all of the information together, at least for my sake!!

Is there PPP software out there now for the Atari 8-bit?

If not, is anyone currently working on it?

Is there FTP, IRC, or Web Browsers out there for the 8-bit? Any under development?

Seems like I saw a few posts about Project Phoenix. Is that available to the public yet?

Thanks gang. I came across some web sites where the Commies had this underway, and I was wondering if any souls who are better programmers than me had started on this.

Later!!

Dan

Nope. Not as far as I've been able to locate. Not for *ANY* 6502 platform.
I've received LOTS of mail about whether the 6502 can handle it or not, too.
I'm personally going to determine it, however. It should, by all my
preliminary examinations.

Project: PHOENIX is underway, which will be a text-based web browser. News
about it will be found here or at the web page (graphic intensive because I
haven't revamped it due to other responsibilities at present. You'll find
the info at either Atari 2000 location:
http://www.geocities.com/SiliconValley/Chip/3904/
http://members.tripod.com/~morloc

>
>Seems like I saw a few posts about Project Phoenix. Is that available to
>the public yet?
No. The initial (beta) version should be out in March '99. It will offer
certain features to the general public that will show what PHOENIX is
designed to do, but the beta testing of the full version will be available
only to a limited group of Atari users before its final release, likely to
be distributed via Video 61 in a cartridge form. More details on the
distribution issue will be forthcoming when I have a viable product to
market, folks!

>

I was directed toward the C64 sites, too, for a variety of information, and
was pleased to not only find what I needed, but information that helped me
decide my next project, too... a linux OS for the 6502... Project: ANTIX!

>by a Atari 400... ;)

Membrane style keyboards are ideal in exceedingly dirty environments
(automotive repair companies, manufacturing, etc). The only
alternative is to have a rubber "safe skin" over a standard keyboard.
Unfortunately, the latter is the less desirable of the two because:
(A) the keyboard is still a mechanical device and, therefore, more
likely to fail, and: (B) "safe skins" have a tendency of ripping apart
in very little time.

That would have been nice, especially if the colors were palette
redefinable and had hardware support for fluid animation, neither of
which the C-128-only graphics chip had. Of course, for those we'd need
an AMIGA. =-)

The *MAJOR* stumbling blocks for the C-128's VDC in relation to
excellent animation was lack of hardware support (sprites, fine
scrolling, etc) and a port-only addressing scheme.

>Is that true or is the skewing of the format allowing the head to
>eliminate seeking the next sector from track to track?

Both are required. If the SIO rate was not
able to "digest" the data, the sector would
pass until the next revolution. If SIO is
ready for the next sector, then as soon as it
passes, it is read. As evidence, format a disk
with US Skew, and use it with the stock OS.
Everything slows down. Now use a regular
format disk with US SIO routines. Sounds
a little funny, but the times are essentially
the same. Now put them together (and listen
to the SIO burst symphony!)

Simple grounding. Removing those connections would more than likely
not affect the computer (except for, possibly, introducing more
interference on the TV display).

There were at least three slightly different models of the 800XL, each
of which, I believe, was manufactured by a different plant.

It looks to me like you are, in essence, multiplexing the PMs vertically,
which the 64 can also do. But I don't see how the above will duplicate
a 21x24 sprite, let alone eight of them (let alone 10s to 100s of them,
multiplexed).

>> But what is important here is that they are all on the same horizontal
>> line, without any exceptional programming effort. I mentioned the

>
>See my point? Why are more colors in the horizontal plane more important
>then 16 times as many colors in the vertical? I say it is a straight

Because more colors in the horizonal are quite a bit more useful than
more colors in the vertical. For example, which looks better -- an
Amiga 320x200 64-color picture, or an Atari 320x200 128-vertical-colors

picture? Which is more useful?

I reckon I'm beating a dead horse here, but, as a programmer, I have all kinds of practical uses for the color ram, but I think the most I could do with vertical splits is make some pretty demo effects. Not only is the former more valuable for serious programming, but it makes all the advanced 64 graphics effects like FLI possible.

Anyways, I just apply my test -- pick 10 programs (e.g. games) out of the disk box, and see what they do. Do they use lots of vertical splits, or is Rescue on Fractalus more emblematic of the feature (2 or 3 screen divisions)? Does it feature tiles? Background images? Any place sprites could be used? Is the screen divided into different areas? Finally, how would the program differ if the hardware feature were removed? Then apply the same test to 10 C64 games, and see what happens.

Since I mentioned Hacker perviously, I went ahead and took a look at it this morning. The screen is divided into four separate windows, three upper ones and one large lower one. The upper ones display text, graphics, and a compass, and the lower a map. The same graphics window displays black tunnels, brown tunnel walls, outdoor scenes, and nighttime infrared scenes. Without the 64's hardware features, I believe the game would be significantly diminished. The program is colorful, detailed, and enormously enjoyable -- in short, a typical example of what the 64 is and was capable of.

>Assuming you have it set up right *which* I have no idea which hoops to
>jump through, then it is just store the 12345 in the Pokey 16 bit
>hardware registers. The interupt generated when it finishes is pretty

Yes, thanks. As I indicated to Aaron, I figured it could be done, but couldn't see how to do it.

I think you'll agree, however, that the 64's timers are significantly more powerful and flexible. Not a huge advantage, perhaps, but a useful feature I wanted to point out.

Anyways, thanks for all the info and input -- it has been interesting and enlightening.

>
>But your retinas are exactly that, a couple of 2D surfaces. Any "3D"
>you see is something your brain made up.

Exactly right. The brain constructs an image based on a number of
sensory inputs. So how do we know the world is actually three
dimensional, that this perception is not merely an artifact of
the brain? Well, all tests so far indicate that the world is
indeed three dimensional (spatially), but it's still something to
ponder late at night.

Regarding the 2D retinas, one could imagine standing in front of
a very large window, and looking out at the world. If the window
were a very detailed painting, however, how would we perceive any
difference? My feeling is that the sensation of 3D isn't as great
with a computer because the brain sees the monitor as a small object
in a large surrounding, and adjusts the image accordingly. A very
large image, however, ought to indeed produce three-dimensional
sensations, and my experience at the IMAX (or even better the curved
IMAX theaters) certainly seems to back up that claim.

But if anyone out there still thinks that "computers can't do 3D",
well, let me assure you that compters can not only do 3D, they can
do 4D, 5D, 20D, 100D, and even fractional dimensions. "Dimension"
is not some arbitrary abstraction.

Although I don't doubt your statement per se... are you sure of the
above? Is there some additional part to the story? The reason I
ask is that not only is Atari documentation still fairly sparse and
difficult to come by, but for years I have heard persistant anecdotes
about early developers who were unable to find detailed hardware
specifications, and were even told by Atari that certain known
features didn't exist!

[Atari generates interrupt as part of display list]

>bit 7 causes a DLI (Display List Interrupt) for that line. This is
>essentially equivalent to a C-64 RASTER INTERRUPT.

Correct so far. Since the two do exactly the same thing -- generate
an interrupt on a raster line -- I think you'll agree that your
characterization of DLIs as being more "sophisticated" is rather
silly :).

A 64 programmer would never generate an interrupt on every raster
line, incidentally (on a stock machine at least) -- it's much easier
and more efficient to simply time the code appropriately (65 cycles
per NTSC raster line, you know...).

Finally, regarding efficiency, considering that the display list requires
1 DMA cycle/byte... well, you can set up an awful lot of raster interrupts
in 200 cycles.

Incidentally, while I think display lists are neat, and certainly have
their uses, I always felt they were inspired by the Atari 2600, where
the CPU has to generate every line of the display. Instead of making
the programmer generate every line of the display, it seems more
reasonable to me to generate every line the same way unless the
programmer specifies otherwise, since that is how most programs
operate.

One thing I'm sure we can agree on is that the lack of any sort of
raster-based interrupt mechanism on a typical PC card is quite lame.

First, it is probably the simplest and most effective possible routine
(I use my own version all the time).

Second, that's why it has been around for so many years on 6502
computers -- example code is on the original Merlin disks, for
example. I wonder how far back the routine actually goes?

Third, it is spelled "kludge" (and pronounced klooj).

>3 different ones.. and they have been extremely intelligent (pretty hard
>to code a good virus on the 64).

I have a few things to say.
1) The notion of viruses is irrelevant to the value of software
bootable DOS vs. locked in ROM DOS.
2) Viruses do not need to be boot sector types
3) There is not even one reported case of a virus (boot sector or
otherwise) for the Atari8 that I am aware of.
4) A software based DOS is superior to a locked in ROM one, because it
is easier to upgrade or replace altogether with something totaly
different.
5) and finally, one does not have to boot with something they do not
wish to boot with when using software based booting.

Well, first of all, "millions" is commonly used to denote "a lot",
e.g. millions of cars on the road.

However, plurality in general implies not "two or more", but "more
than one". Thus 1.25 million surely qualifies as "more than one million".

Bascially, if only you had color ram and some decent sprites, you'd
understand this complex technical issue.

Ok, on the Mux you have actually available to you is:

1. Master computer, you have to have a Master Computer, with a Hard Drive.. Then you can attach 7 computers, to the Master as Slave Units, can be Atari 400, 800, 800xl, 130xe or anything above, 1200xl ect. These units do not have to have hard disks attached to them but they may have, you can swap between units to backup, exchange data ect..If you have BBS Express! Professional that acknowledges the Mux you can have up to 7 BBS's running at the same time if you have the hardware and software to run your computer. You also need phone lines into each Atari 850, ICD MIO, or Black Box, or PRC:connettion to run this software.

If you want an Atari Computer that will be

1. easy to upgrade the 130 XE it the best

2. If you want a kyebaord that is gteat then the 1200XL is best

3. If you want a general use computer then the 800XL is best

4. If you want a Tank! then the 800 is best can be upgraded to 256k and up axelon compatable but, may crap out with the upgrade putting componets to the test.

5. If you are a diehard then the 400 is the best with a 48k upgrade and a keyboard upgrade

6. Depends upon your needs, computer preference and availability of the product

>

And what I'm saying is, your measured value is not an integer, it is 2.000, which equals 2 plus or minus 5/10,000. The integer 2, by comparison, is 2 plus or minus zero, that is 2 to infinite precision. When you measure the weight at 2.000 and say it is the integer 2, you are implicitly approximating the measured value to a more convenient theoretical value, a rational number. The same implicit approximation happens when we measure 2.500 and say it is 2 1/2. This approximation adds precision to the value (all rational numbers, as someone else pointed out, have infinite precision) without gathering any more information, and so, in a sense, it adds some error. But it's ok, because it makes no difference in calculating the cost of shipping on a package. (In other cases, such as often occur in engineering, it would be more important to recognize the specific limit to the precision of a measurement and not to approximate it by a rational number.) When it all boils down, this is really a semantic issue about the definition of an integer.

--
Since this is probably the last time I'll post in this thread (--finally it seems pretty much resolved--), I just want to say to everyone else who posted that it's great to see that so many people, contrary to what the media would have us believe, do actually exercise their minds and think about theoretical stuff, and care about getting it right. I didn't start this thread, but still, I appreciate all of you who joined in, and I hope to do this again sometime, on another subject (and in a more appropriate newsgroup). Well, signing off. --

ATARI 400 KEYBOARDS ROCK!!!!! :)

Well, actually, I'll give them a star for being unique at least. My first venture into the Atari world was the Atari 400. It was a membrane keyboard (similar to a keyboard on a McDonald's cash register).. which made it easy to clean. Besides the Odessey, this was one of the few membrane keyboard computers ever released. (I would love to hear of others!)

I have amazed people with my ability to smoke keyboards, and people were amazed at work when I took my typing test and got further along in the typing test than most ever do.
I have to thank the 400 keyboard... because I learned how to type of that %*&#$ keyboard day in and day out on the computer bulletin boards. When I finally got a computer with a touch-type keyboard it would like taking the govenor off an engine. :)

Hmmm... the best keyboard I have seen strangely enough.. or those that impressed me... the Atari 400 for being unique as mentioned before... I like the typing feel of the Atari 800 and 800XL... and then I liked strangely the Tandy Color computer's keyboard.

My ultimate dream keyboard is a heat sensitive keyboard similar to the keypad on a microwave we got from the early seventies. Now that would be the bomb! (And a membrane keyboard... but with an attitude!)

I always raised an eyebrow when I see Dillenger's computer in TRON.. the desk with the inset screen and a membrane/touch screen keyboard on the desk's surface. I always wondered... had the writer been inspired by a Atari 400... ;)

Doctor Clu

PS: Worse keyboard ever... Atari 65 XE...

1500. Re: Atari 800XL keyboard question

Newsgroup: comp.sys.atari.8bit

From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <78ufng$ina@enews2.newsguy.com>
Source record: 55436

I was just wondering...

I've had many Atari 8-bits over the years (my first being an 800XL back in 1983/1984). Anyway, I still have most of my collection, and I recently picked up another 800XL and 1050 (and several cables) at a Goodwill for $10.

Well, the keyboard in the Goodwill 800XL had a stuck letter "I", so I opened it up, and replaced the bad keyboard with my original (the one I've had since the beginning) 800XL keyboard - since my original 800XL only shows a bright green screen when powered up [any ideas what's wrong?]

Anyway, the point is, my original 800XL keyboard was simply connected with the ribbon cable to the mother board. That's it.

The Goodwill 800XL was also connected with the ribbon cable, but had 2 wires soldered to the screws that hold the cartridge port "doors" on, and they were also soldered together, and then 1 wire went to a screw on the keyboard assembly itself, and the other to the mother board. What are these for anyway!?

BTW: The keyboard swap worked fine.

Interesting to note, the Apple III was the computer that Flynn used while supposedly trying to hack into ENCOM mainframe at the beginning of the movie TRON.

I actually picked up a Apple III for $5 years ago. We tried to power it up, nothing, but made a nice museum piece. Heavy sucker... a Apple II size computer case, attached firmly with a sheet of metal to the keyboard.

1504. JEFF MINTER ON TEMPEST 3000, NUON, C64, EMULATION

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-31 00:00:00 UTC
From: pnguyen@ucla.edu
Message-ID: <790p96kin1@carroll.library.ucla.edu>
Source record: 55270

I came across this interview and I thought you guys might like it...

ManBeast v Jeff Minter (Game Programmer For Llamasoft)

Hey Jeff

baa!

First I would like to say thank you for participating
in this interview.

dim ots, dude!

Well first basic question is to to tell us a little
about yourself and your work presently?

well, I've happily returned to the wilds of West Wales
after a few years out in the US, where I went through
the Last Days of Atari, which was an interesting, if
ultimately saddening experience... but which led to my
getting my present job, which is top, so I mustn't
complain. And it was fun to be part of Atari, even for
a little while, given that they were so huge during the
dawn of gaming. There were odds and sods lying around
the bunker on Borregas that would make a collector of
rarities weep :-).

Now I'm employed by VM Labs, charged with the mission
of messing around on the NUON (the hardware formerly
known as Project X) chipset, and hopefully coming up
with some nice goodies for it :-). My current projects
are what I guess you would call Tempest 3000, and a
sound-to-graphics program similar to the idea that we
put in the Atari Jag CD-ROM called VLM (Virtual Light
Machine). Of the two, T3K is currently the most
developed - it is just now getting to the point of
passing the "play it in a dark room with loud techno
on" test - does it feel like it's gonna grab you by the
nads and have you playing until your thumbs bleed? The
answer is increasingly looking like it's gonna be "yes,
indeed, take me, I'm yours" :-).

You can get some idea of what T3K is going to look like
by looking at what I did with T2K on the Jag, and
extrapolating. Where there are pixel particle-systems
in T2K, there are p-systems made of translucent, shaded
antialiased disks on 3K. Where T2K had normal linedraw

vectors, we now have glowing, neon, translucent, antialiased lines that look a lot more like what "real" vector displays generate, except that they can be of an arbitrary thickness and have neat radiussed ends that glow in a very pleasing manner where they intersect. Everything is translucent; everything blends and flows. I'm trying very much to get away from the typical polygonal look that most 3D games have, these days... I want this to look utterly unlike anything that runs on a 'Station or a Ninty, to emphasize the versatility of the Nuon chip (which, by its very nature, is not tied to any one rendering model), and also, after years of loadsapolys, the aesthetic appeals to me. I always loved the clean, abstract look of the old vector games, their purity and lack of pixel artifacts. With the Nuon chip I can achieve a similar pure feel - my aim in the game is to have no discernable visible pixels - and make my game look very different from what everyone has become used to.

How did you first get into programming and what made you decide to program and design videogames?

I first got into it accidentally, really - I was at 6th form college, I had played some of the early coin-ops like Space Invaders and Pong, but never connected them to anything I could actually *do*... until I wandered into the wrong room one day and there was a guy playing a really crude racing game on the Commodore Pet, and I asked him how he got the machine to play games, and he told me that he had "typed it in". The idea that you could type stuff into a machine and get it to play games intrigued me. I got a book on BASIC out of the library, blagged my brother's book of TI-59 calculator programs off him, and, despite not knowing either BASIC or TI-59 language, had a crack at transcribing a TI-59 biorhythm program into BASIC. The next morning I went in early to college and got it running on the PET. It was bollocks and probably profoundly incorrect, but once I realised I could tell the PET what to do, I was hooked :-).

Before long I was writing some simple games for myself and the other nerds who hung around the computer to use, and before long it became apparent that PET Basic was as slow as molasses for moving any reasonable amount of shit around. I had heard that something called "machine language" was supposed to be faster, so I borrowed a book on that, and my first hex program followed. I was amazed at the speed difference - it wasn't like C, the hex version of a loop to plot and

invert the PET charset in video RAM ran around 1000 times faster than the BASIC! So I started writing hybrid Basic games with hex routines to shovel video memory around, eventually leading to my first all-hex game. It was based on Exidy "Star Fire" (when are they gonna finish off the MAME driver?). It was about 5K of hand-assembled hex on the old PET, developed on an 8K system with a cassette drive, Ghu bless it. I only had half an hour PET time a day, so you'd spend the first five minutes loading in your hex poker, twenty minutes actually entering code that you had painstakingly written when everyone thought you were actually making notes in an English Lit class [:-)]. and then the last five minutes trying to figure out why it crashed . You got sound effects in the game by putting an AM radio next to the computer. You could throw the CPU into differently timed loops, and, if you tuned the radio correctly, the RF emissions sounded like some pretty good zaps and explosion noises :-).

Before I left college it got to the point where everyone used to hang around after school and play the games I'd made. But it was only a couple of years later, when more people had computers and games became something you could sell, that I thought about doing games for a living. I got forcibly suspended from the usual course through University to get a degree due largely to illness, and while I was ill, I wrote what was to be Llamasoft's first game, on a Vic-20. I had done a couple of little things on the ZX-80 and ZX-81 prior to that, but I got ripped off something rotten by the people who ran the company that sold it, so I decided to release the Vic game myself, with the help of my mum to run the business side of Llamasoft. A lot of the stuff being sold at that time was unmitigated bollocks badly written in BASIC, so even my somewhat buggy hex code on the Vic got noticed. That was pretty much the start of it.

How have you seen the videogame industry change from the time that you have been involved in it?

Well, back in the early days it was very much individual hackers working out of bedrooms and backrooms who created the code. I'm speaking for the home computer industry of the time, of course - it was different in coin-op and in the likes of Atari, natch, but still there was scope for individuals to put their stamp on a game. You had the likes of Theurer and Huge Euge Jarvis in coin-op, and people like Doug Neubauer on the Atari... nowadays everything is done in teams,

and it is rare that an individual is identified with a game, except in the case of Miyamoto-san. Some of that is inevitably driven by the improving resolution of the medium - you could get away with crappily drawn sprites on the C64, coz the rez was so low that nobody knew any better. But now you better work with a graphic artist or people will notice that you're a better coder than you are an artist :-). 99 percent of my stuff in T3K is algo generated, so that's not so important to me, but I will still need to work with musicians so that the soundtrack is sufficiently kicking, at least for now until we get algo composing a bit more refined. But it is increasingly rare that one guy be actually allowed to define all the real "game" stuff that goes into a project, and I am grateful that VM allow me that freedom.

Games also seem to me to be becoming increasingly genericized. "Doom" comes out, and everybody clones it. Ditto "Quake". Ditto "Tomb Raider". After a while you get overwhelmed by it all. I haven't bought a FPS for my PC for months because I already basically have enough good versions of that genre, I don't need any more. I have a fave racer, a fave FPS, I don't need to spend more money on yet another variant. Occasionally I am surprised, and something good and original does come out, but that tends to be the exception rather than the rule.

What system/platform did you enjoy the most and what game are you most proud of?

Most fun was prolly the c64 - it was easy and fun to program on, there was a large user base of people willing to buy my weirdo games, so I had a lot of fun on the platform and was quite prolific. I think my favourite design on the c64 is probably Hover Bovver - it was actually a joint design between me and my dad, and it's the c64 game of mine that I most frequently dig out for a quick trot down memory lane with an emulator. It's a nice, gentle, semi-strategic kind of a game with a degree of humour. It would have made a great table-top coin-op down the pub, back when they used to have such things - I can just imagine sitting down for a nice game of HB with a mate over a couple of pints :-). Someone emailed me the other day saying they thought it'd make a good colour Game Boy game - I guess it would, the gentle pace and simple graphics would be spot on for the GB. One of these days I'm gonna do an update. I actually started an Intellivision version a couple of years ago, but I haven't had time to work on

that for awhile...

Best overall though, I would have to say T2K on the Jag. Everything fit together nicely in that game - gameplay, trippy graphics, and great tunes. It was just a shame the Jag never sold enough to make the game really mainstream. Oh well, there's always T3K on the Nuon :-)

What is your initial thoughts on game emulation? I've noticed a lot of information on emulation on your homepage so I guess you are in > favor of it.

I think emulation is a most excellent thing. It's really cool for anyone interested in the history of games and computers to be actually able to use the systems and software as well as just reading about them. It's interesting for any game designer to be able to look back on those early games, and see what was good and what's withstood the test of time - although many old games look a lot worse than we remember them when we actually take off the rose tinted specs and play them again, some of them are still great games that stand up well, in terms of gameplay if not in terms of graphical finesse, when measured against the current state of the art. I think it's a great shame that the copyright people are now going so mental trying to prevent people having access to the ROM images of these old games, too - I mean, there is very little chance of anyone actually making any money out of such ancient games, and it seems unnecessarily mean to prevent people having a little fun and nostalgia by playing them on emulators. If there is any money to be made from old game titles, then surely it is by releasing updated versions of the classics, like T2K and other updates such as those released by Activision and Hasbro. And, in that case, it would actually work to the copyright holders' advantage to allow the old, original versions to be floating around - someone might rediscover Asteroids or Centipede on an emu, remember how much fun they had, and then be motivated to go out and buy the all new, spiffy 1999 version for their PC.

I'm quite happy to make all of Llamasoft's old games available freely to emulator users. I'm certainly not selling all that old c64 software any more, and if someone enjoys firing up an emulator and reliving a misspent youth playing Revenge of the Mutant Camels or whatever, then it's no skin off my nose, is it? Sure, I'd be pissed off if someone blagged one of my designs and used it as the basis for a commercial, modern game,

but ten year old code that will never make me any more money, and that will give people a good laugh to play? Why should I deny them the pleasure? It's a shame that the owners of all those old ROM images can't think the same way. It's just petty-minded bollocks trying to hound them off the net.

Do you feel emulation harms or hinders videogame companies or helps to keep older games alive?

See above, basically. I don't think it does any harm - quite the opposite, in fact.

Do you have any other thoughts or plugs you wish to address? =)

hehe... not really... except "Buy Nuon!! T3K is gonna be great!!" (hehehe)

Thank you again for allowing me the pleasure of interviewing you.

no problem, sorry it took me awhile!

There are companies selling dust-proof and water-proof keyboards on
the Web. I found them in my quest for the Best PC Keyboard In The
Universe. Their everything-proof keyboards are all membrane-style.

I call safe-skins "keyboard condoms". They provide some security,
but you just can't get the same satisfying tactile feedback when
you use one.

Well, we can touch things, make knots in pieces of strings, and
so on. Maybe the world really doesn't have three spatial dimensions
at the quantum level, but it's a close enough approximation for
all macroscopic purposes.

> Regarding the 2D retinas, one could imagine standing in front of

To be nitpicky, one would need two slightly different paintings, one
in front of each eye, to account for parallax.

Indeed. People who got motion sickness from games such as Doom and
Descent usually played in full-screen mode on a large monitor, in a
darkened room.

I tend to agree. As I mentioned in a previous article, during the mid to late 80's I attempted to look for info on the Atari's hardware/OS programming methods. My major source (at the time) was in Creative Computing microfiche back-issues from '82-'84. The articles tended to specify how hard it was to obtain such information and the magazine had to rely on programmers that actually wrote some of the earliest commercial programs.

1510. FS - PRISTINE Portfolio

Maybe premature since we don't know everything a C64 can do.

Not sure if you have a handle on this, but the Atari ANTIC chip was a processor with its own instruction set. Very limited in terms of it only did things a graphics processor would do, no floating point to say the least.

I should look it up to make sure, I believe the processor type was Harvard vs Nueman<?>. That is, the 8 bit data was divided such that you had both the instruction & the data in the same byte.

This is one of the reasons why the Atari was limited to 16 graphics modes, that is the graphics modes were encoded into the lower 4 bits while the instruction was in the higher nibble.

The Atari Display Lists were actually instructions. That is, things like: Display this line as 5 color 8X8 chr mode and interpret the next to two bytes as an address in the 64k range of memory to start retrieving your next set of display data.

Of course you are limited to 16 instuctions as well as the 16 graphics mode, but 16 is enough to do just about anything you would want a graphics chip to do. Branching, allowing/having interupts to the 6502, changing display retrieval location. All of this without 6502 intervention unless you allow it.
>

> in 200 cycles.
This is accurate for a C64 maybe, but just plain wrong as far as efficency goes for what goes on in an Atari. You can't and I repeat, you can't beat a Harvard processor for cycles per punch. All the stuff they are doing now with pipelining etcetera on complex processors is an

attempt to try and be equal.
>
> Incidentally, while I think display lists are neat, and certainly have

This would imply they are a derivation of the technique vs a silicon solution that employed a completely novel approach to solving the same problem. We will have to agree to disagree on this. I say coming up with your own processor that uses high & low nibbles to encode both instructions and data in a byte is just so off the wall different, it isn't even in the same ball park.

>
> One thing I'm sure we can agree on is that the lack of any sort of

Not multiplexed. Not sure if a C64 can do this, but...
let's say you have one of your 21X24 sprites, each * represents 7 bits
so the *** means 21 bits wide.
***
***
***
***
Can you change that into:
***
***
***
***
with the sprite shift, one pixel or better yet one scan line high?
>

> picture? Which is more useful?
Far and away, the pictures I have seen using the technique on the Atari
have looked better then the pictures I have seen on the C64, the Amiga
of course is much better. I am even happy with the Atari's 16 shade in
80X192 bitmapped mode. Turns out this was more then enough to do some
fairly nice black and white digitized photo reproduction.

But then, it depends on what you are looking at. For me, give me the
subtle transition of a sunset going from from shades of dark blue sky,
to light blue, to orange in 30-40 transitions.

Subjective.

Frogger is Frogger. It uses the Atari redefined 5 color mode chr sets
for most of the objects, some player missle graphics, Antics Load Memory
Scan instructions and fine scrolling in hardware to do what it does. I
have seen it on the C64 & don't think it is better or took less effort
to program. Game play is absolutely the same too.

Played some Choplifter on my nephew's C64. I didn't think it was that
much worse or that much better then the Atari version. Certainly nothing
to write home about i.e. "Sell your Atari & buy a C64! I just played
Choplifter!". Honestly, I thought the Atari version of Choplifter was a
bit better then the C64 anyway, but then both versions didn't exactly
push the machines.

Biggest 'bitch' I have about it is C64 got Pools of Radiance which used
that format, but then, Alternate Reality is probably my favorite RPG of
all time & it resided quite happily on the Atari. It is a classic
example of an implementation that took advantage of the Atari's features
was at least equal too if not superior to the C64 version. Of course, I
like the 8bit version of The City better then the ST version, so it is a
matter of taste.

In general, I don't play adventure games so it does have the effect of
blinding me to Hackers. That is, first impression is, "That is an
Adventure game, who cares?" which isn't the point of the debate. Maybe
someone that has played Hackers on both the Atari & C64 can comment as
it would be more useful. I know it came out on the Atari, just have
never even had the desire to even look at a screen shot.

Just that they only sold a couple of million at best Ataris, so not many
cared enough to do a good job.

The "PET" stood for Personal Electronic Transactor, with an eye on using it for online banking and E-Mail services. I have collected most models from the 4016 to the 2001, and most work. They also had a IEEE-488 port (HPIB or GPIB) to connect the intelligent peripherials, as well as thousands of pieces of test and automation equipment, and out preformed the HP 85 comuter (A real dog! I'm glad the last one is dying at work) It also cost 1/10th of the HP85 (which used data carts with a couple hundred K of memory) With inteligent pereperials you didn'd need a lot of memory to support them. No device drivers were needed, and at the time, a 32k X 8 ram board for the S100 buss could run well over $1000, and some of those only had 256 BYTES of ram, not Kbytes. The software was modular, but with fast and reliable IEEE drives (The 8050, 4040, and SFD1001) the weren't too bad for their day. Also remember the old IBM mainframes (IBM360) had a clock rate under 1 MHZ, and usually had 256K to 512K to run a whole business through slow dumb terminals

I default to what John Harris said, that is ~reverse engineering of programs was not really done since the Technical Refernce came out shortly after the computers.

As a side note, one of the oldest Atari shops around, B&C Computer Visions, still has a lot of the the Tech Ref & De Rey Atari manuals. One day I was in the shop doing my normal gadfly/BSing & the owner said something along the lines of ~I just sold 3 tons<thousand pounds? pallets? been to long> of Tech Ref manuals to a paper recycler. Couldn't even get rid of them at $10 each.

I say something along the lines of "Kind of a waste".

He says, "Don't worry, I still have another ton of them".

The C!28 can also be switched to different pages in the video memory. I believe the standard 64K memory allowed 12 pages, byt the ones with 256K could do an extra 48. It was great for displying help screens and menues, and would leave other work screens unchanged. There was also software to use the extra memory as a RAM Disk

A serial cable is easy! a piece of five conductor cable with a shield, and two standard 6 pin DIN plugs(Radio Shack?) Use a meter to find the ground pin at the drive. Connect the shield to the ground pin and wire the other five pin for pin (1-1, 2-2 etc)
I found some surplus five conductor CB mike cables (Remember that fad?) and made coiled drive cables. (The Central Florida Commodore Users Group loved them!) They made it easy ro keep your desk neet, and to move equipment

Just my op. I am not really a hardware guy. But of your 40 pin LSI
devices, green screen or any screen for that matter, means at least your
clock signals are working so your GTIA & probably Antic are fine.

Blue screen with noise probably means your Pokey is kaput.

The XLs IIRC will boot fine even with a broken PIA, just they won't read
joysticks, etcetera.

I am thinking a green screen may mean a broken 6502C. At least that is
where I would start. It is a special 6502, not an off the shelf part, so
you have to substitute if you can.

I am also the purveyor of a slightly goofy theory. Chemist by trade so I
have a tendancy to look for that as a solution.

I think slightly different compositions in the tinning on chip leads &
the sockets they go into has a tendancy to produce oxides/galvonic
cells, that kind of thing.

Try leaving the computer on overnight, then cycling the power a few
times. That should get rid of any inadvertant 'cells' that could have

formed.

That sounds like the old man who asked at every meeting how to format a disk, so I gave him a formatting program, and he couldn't even figure out that the message "Press any key to forat a disk" meant! In all seriousness, I only used the C64
manual to show new members the basics, but I do have seeral programers refernce guides for th 64 and 128, as well as on the 1541 dos. By the way, neither the Commodore or Atarir DOS's "load" They execute from the ROM's, and that's why you couldn't have a virus damge your DOS, but they could damage program or user files, on a disk.
I've repaired Commodore equipment since 1982, and I saw the first C128 at the Dayton Ohio Hsmfest and talked to the marketing people, and I think I still have the original data sheets on the C128, the 1571, and a 1572 (Dual 1571) disk drive that was never relased in th US because software companys were screamiing they were only good for pirating software, and CBM caved in and didn't release it. Istill have one of my C128D's on my computer desk with a built in 1581 drive. (A little modification!) If enough people are interested, I'll see about writing a conversion article for the existing 1571 controller in the C128D

This is a line from the memory mapper chip in there. Decodes the
hardware space into the $D000 to $D7FF area into 8 chunks as full pages.
>
> 'S' is B0Z Phase 2 clock what is it for?
This is a sync line used for use with the 6502 family of chips. Same
type of thing is used on the 68xx chips, 'cept there they call it a
B<something like that VME?> line.

The two lines are so you can add chips directly to the cartridge port.
For instance, you could add another 6520, 6551, or 256 bytes of ram to
the hardware region. The S would be tied to the phase 2 clock of the
68xx/65xx family of chips while the CARTCTRL would be tied to the !CS
pin of any chips/memory you would add.

I have a bit of a problem with the APE / ProSystem

Why can the Atari see my laptop with APE running as a disk drive, and can LOAD programs FROM it, (even on Mega .ATR 'disks') but I can't copy from mega .ATRs.

I get ERROR 164, file # errors.

My goal is to make 'collection disks' for myself that are single or double density, but a Mega .ATR is like 1.02 Megabytes.

How can I do this?

Thanks in advance. Tony

You're forgetting the 1541 only had 2k of RAM. And their were three versions of the ROM one for the VIC20, a early one for the C64, and the final version that was supposed to eliminate a bug I never could duplicate. If you want to copy 1541 disks find a copy of Fasthacken 6 or 7 and a second drive. load the program into the first drive, turn on the second, load it, unplug the cable from trhe first drive to the computer and shove both disks in at the same time and quickly clse the doors. About 21 seconds later you have formatted and

copied the original disk. Just remember to write protect the original, and to remove both disks at the same time. It uses the write protect sensor to detect disk changes and will get out of sync if you try using it any other way. By the way, Version 7 was never officially released. I got mine after the software house decided not to handle the program and a few people got it directly from the programmer.

On 30 Jan 1999 21:10:04 GMT, matchalot@aol.com (MatchALot) wrote:

>What's the best Atari 8-bit computer?

(NOTE: for the quick suggestion, look at the last paragraph of this message)

First, here's a list of all the Atari 8-bits (that I remember) and their general age (NOTE: I'm not going to list versions that had a very limited release or were canceled before release):

1979 Atari 400 Atari 800
1982 Atari 1200XL
1983 Atari 600XL Atari 800XL
1985 Atari 65XE Atari 130XE
1987 Atari XE Game System

Of the above computers, the Atari 400 & Atari 600XL are the least desirable because of the extremely limited amount of included RAM (only 8-16K)

The Atari XE Game Machine is an oddity. It's the only one with a separate keyboard. It also has huge pastel colored buttons. It's also tough to find. However, unless you're a collector, I wouldn't recommend it.

The most desirable Atari 8-bits (in my opinion) were the Atari 800, 1200XL, 800XL, & Atari 130XE. Each of these 4 computers had various strengths and problems as listed below:

The Atari 800 is pretty much the granddady of them all. It looks as ancient as the original Apple II line. Here are the following advantages and problems:

ADVANTAGES
* Can be easily upgraded to a full 48K (if it hasn't already)
* 4 hidden slots (located behind the cartridge ports) which allows one to easily diagnose a RAM problem (via switching the RAM cards around) and replace faulty RAM chips (by popping out the individual 16Kit DRAM chips). Another benefit of these RAM slots is the ability to easily add an 80 column card (if one can be found).
* The only Atari 8-bit with two cartridge slots (right & left). Most cartridges (games & programming languages such as BASIC) were inserted into the left cartridge slot. These same cartridges would be placed in the only cartridge slot of later models (XL & XE series). A small number of utility cartridges (Monkey Wrench) took advantage of the right cartridge slot. This slot is unavailable in later models. This

advantage should not be considered very important.
* 4 joystick ports which a small number of games (MULE?) take advantage of. Beginning with the XL series, the number of joystick ports were reduced to only 2.
* Second best keyboard (1200XL being the best)
* disk based programs can be loaded up without the need to hold down the OPTION key (an annoyance introduced in the XL series and continued in the XE series)
* built like a tank with lots (and I mean LOTS) of shielding which produces a rock steady picture.
* Splits the composite video into separate Chroma/Luma output for monitors that can handle it.
* a simple power supply connector. (if the original power supply dies and another "official" power supply can't be found, one could be kludged without two much difficulty...although I've never needed to do it).

PROBLEMS
* will not run software specifically designed for the XL/XE series of computers (ie those that require more than 48K of RAM)
* some older 800 models contained an older video chip called CTIA (as opposed to the later GTIA). The following special modes are: 16 colors of one luminance on any single horizontal scan line (producing a pastel rainbow effect), 16 luminances of a single color on any single horizontal scan line (for incredible 3 dimensional shading effects) and 9 freely definable colors on any single horizontal scan line . NOTE: few programs take advantage of these special modes (one being Lucasfilm's excellent KORONIS RIFT).

The Atari 1200XL's are hard to find. The Atari 800XLs are much easier to locate. Here are their advantages/problems:

ADVANTAGES
* can run *most* Atari 400/800 software (more, but not all, can be forced to run properly via a special TRANSLATOR disk which substitutes the newer OS with the 400/800's OS).
* They were the best looking 8-bit computers (beige, brown, & silver).
* 1200XL had the best keyboard.

PROBLEMS
* 800XL's had variable keyboard quality (at least three separate types were manufactured).
* most do not contain separate Chroma/Luma video output for monitors that allow for it.
* forced to hold down the OPTION key when loading most programs (on the 400/800 series, the BASIC programming language is on a separate cartridge. the XL & XE series contain BASIC built into the computer. Unfortunately, the internal XL/XE BASIC ROM prevents the much needed underlying RAM from being available to programs that require it. Holding down the OPTION key disables BASIC).

The Atari 130XE's advantages/problems

ADVANTAGES
* the first (and only) ATARI computer to come with a full 128K as standard (although few programs take advantage of it).
* can run all Atari XL series and *most* Atari 400/800 software (more, but not all, can be forced to run properly via a special TRANSLATOR disk which substitutes the newer OS with the 400/800's OS).
* reasonable keyboard (although a bit mushy for some users).
* very little weight.
* reintroduced the separate Chroma/Luma video signal.

PROBLEMS
* forced to hold down the OPTION key when loading most programs
* cheap looking and felt flimsy when it was held (would make crunching sounds).

For the most flexibility, I'd suggest getting both an Atari 800 & an Atari 130XE.

1528. Raster Interrupts

> per NTSC raster line, you know...).

What if they wanted to do a shaded title text? Like if you had the letter 'A' , 8 scan lines (or pixels high) each scan line would be a shade lighter than the one above it.

I thought of this because thats what they do in the game 'Fort Apocalypse', on the title text.

Actually a cool effect.

Tony

Smart users always lable their disks, and almost every commercial Commodor
program I have has the load instructions printed on the label. I have only a
couple "work" disks without labels, but I try to keep EVERY disk labeled (I
just bout another 2000 blanks) because I can't think, "It was a red disk", and
find it that way. Also. kids usually are more willing to read the manuals
than adults.

So if I used CARTCTRL, with the additional address lines I would be
remapped to the $Dxxx area. If I used SD4 (?) or SD5 (?) where would
that put me? They seem to go to the CS lines of the EPROMS (27C32)
that are in there.

Thanks again.

Tony

Don't blame Commodore for load"$"8 or for load"*",8,1" They used a HP
standard, agreed on by hundreds of lare electronics companys, and developed by
Hewlett Packard. The Load is comon sense, the $ sign was used as a reserved
symbol for a directory, the quote marks allowed you to use spaces and other
characters for file names.. The 8 was the device numer on the buss wher a drive
was located, and ran from 0 to 15. (0 was the computer itself) and you could use
up to eight drives, three printers and address the screen as a perpherial at the
same time. The (,1) tells the comupter, not the drive, that the program is
machine language and has to be loaded at the address specified in the header of
the program. A very efficent and useful design. I've had to run three printers

and four drives for a job one time, and the Commodre out preformed the IBM 286/386 machines of their day

The Apple I? Oh yeah! that thing they threw together with no case, and I think they only ordered 1000 blank circuit boards and may have been sod as a kit. It only used a cassette interface if my old files are right, and was only built to to raise capital to design the Apple II. By the way, a lot of people make fun of the Commodore drive, but several of it's ideas gave it a fairly reliable capacity on a single side single density drive 170K vs 70 K for other machins, plus their 5 bit GCR error checking code it took two extra bits per byte, but didn't use any codes that would allow errors to slip through. Also, the variable sector size is used on some large hard drives, along with a lookup table to squeezee a lot more storage into the center and outer tracks that would go to waste with the coding other companies used. I keep seeing people comparing the "touch" of different computer keyboards, but most Commodore, some Atari, and TI keyboards were made by Mitsumi, and I've used stems, springs and pads between brands to rebuild a lot of keybords, sibnce they used all the same parts

IBM dos 1.0 didn't do much of anything. That's why the original IBM PC had a cassette port. Also, the PC was built in a IBM word processor case because their "Market research" told them the whole world market was under 1000 machines! Somewhere I have a picture of the original wirewrap motherboard. The original PC used the 8088 8bit processor instead of the 8086 16 bit so they could use existing video and printer cards and monochrome monitors, and whe're stuck with a 25 pin printer interface because it was 25 cents cheaper than a 36 pin Amphenol Blue Ribbon (the standard "Centronics" connector)

That's strange My printer uses 8.5X11. And you know what happens if you
make somthing idiot proof? The world breeds bigger idiots.

While I'm at it, what do you expect on the net when all you need is a mouse
and enough brains to remember where you wrote down your login password?

Windows! guarnteed to make users dumber and lazier. After all, you have little say as to how or where a program installs, and it's wide open to hackers and the Virus Creeps to destroy your hard work. I still use Dos on my PC, and plug in a drive with 95 when I go on line (Thank God for plug-in drive adapters) Ihave four, and auto id on my motherboard

The SX64 replaced the SHIFT/RUN tape routine to run the first program on a disk. I always had a menu on my disks, and two keystrokes loaded my menu. If you can find the SX64 rom it will work with a standard 64, but it might be in a 128k rom instead of two 64K roms

It's not nested, though. It's pretty hackish overall--it takes something
like a CMD device to have "regular" subdirectory trees.

> Not multiplexed. Not sure if a C64 can do this, but...
> let's say you have one of your 21X24 sprites, each * represents 7 bits

24 x 21 - each sprite is 24 pixels wide and 21 rasters tall.

> Can you change that into:
> ***
> ***
> ***
> ***
> with the sprite shift, one pixel or better yet one scan line high?

Sure you can. You can shift it just one pixel, or across the entire width of the screen if you want to. Raster by raster, line by line.

This technique, when done less than 8 pixels wide, is just a wave or sinus. More than 8 pixels worth of shift and it is called a "tech tech" in Commodore circles. I guess the 8-pixel crossover comes from using character maps instead of sprites for waves and such. Sprites have a crossover point at 256, where they need a second register to supply one more bit of X-position information.

Characters crossover every 8 pixels, corresponding to the 3-bit X-scroll register at $D016.

I believe you can change the vertical position of a sprite as well, for example with a sprite stretcher routine. This allows one to stretch a single sprite up to the entire height of the screen. Granted it just expands the 24x21 image, but so what. If you need more resolution, multiplex that sprite, to give you a 24x200 sprite.

Such multiplexed and stretched sprites can still be waved and scrolled sideways in a simple sinus or tech-tech pattern.

Hardware required? Any dusty old C64.

> Far and away, the pictures I have seen using the technique on the Atari
> have looked better then the pictures I have seen on the C64, the Amiga

Take a look at some of the C64's IFLI or UIFLI formats. These change color cell pointers every raster line and interlace the screen as well. The result is 320x200 with a maximum of 136 colors. The two formats differ in the way they handle the actual bitmapped data, with UIFLI riding on the leading edge of Commodore graphics capabilities.

Hardware requirements? Any dusty old C64.

> of course is much better. I am even happy with the Atari's 16 shade in
> 80X192 bitmapped mode. Turns out this was more then enough to do some
> fairly nice black and white digitized photo reproduction.

MCMLace displays are good for this type of work - 320x200 in 16 greys using
interlaced pseudo-grey mode. It takes some trickery to do it, I7ll admit
that, but it looks good.

See also my URL below for another option for digitized video.

Talking of Apple ///'s, I got one for free from my school's English dept. a few years back. It was working but had a few disks missing, and the single floppy drive was faulty, so I only managed to boot it up a couple of times. It came with a huge external hard drive which was probably about 10Mbs, but I think you had to boot from floppy to see the hard drive. I broke to whole machine trying to fix the floppy drive, so I sold it for about 5 UKP.

I wish it worked and I still had it, since I think it's quite a rare machine.

I am just about positive they used a bit map mode with the text drawn vs generated with Antic/GTIA.

I am pretty sure that is one of the limits in using chr graphics/redefined chr sets on the atari. Character set graphics on the Atari are limited in that once you chose something like the 5 color mode, you are limited to those 5 colors for the next 8 scan lines before Antic fetches its next instruction and you only get 24 instructions in the display list.

I think I may have actually took a look at the DL for some Lucas Flims games like Rescue on Fractilius<sp> & it turned out to be graphics 7.

It's that vertical thing again<grin>. 5 colors x 24 lines or 120 colors on screen at once, but only 5 on any horizontal line.

You can fool the graphics chips into thinking the chr modes are the 16 shade or 4 color or what have you mode, but I never really bothered to work with it. I think for the 16 shade mode, you are limited to 20 chrs per line of redefined chrs. Much easier to just use the bit map mode.

I think the maximum a human eye can percieve is about 16 shades of grey. Thousands of colors of course, but our grey scale doesn't use enough bits.

Error 164 is a DOS-specific code. First off, file numbers are only used by Atari DOS 2.0 and its clones (with straight single or double density disks MYDOS can be considered a "clone" as it does use file numbers there to maintain maximum Atari DOS compatibility). With other FMS, Error 164 might mean something different--SpartaDOS for example, uses it to signal a "locked" file.

If you're trying to use DOS 2.x to copy files from a large MYDOS-produced .ATR, you're going to get file number errors because there just aren't any file numbers in the sector links. Atari DOS will be able to read the directory but won't be able to read the files. You run into the same problem using Atari DOS with MYDOS-formatted enhanced (1050) density disks or TopDOS-format disks.

The solution: use MYDOS (better) or SpartaDOS (best) and copy your files to single or double density disk images (720 sectors in straight DOS 2 format). That way, any DOS 2 clone will be able to read and safely write them except that the horrible kludge known as DOS 2.5 can't handle double density. Do not use enhanced density except possibly with Sparta format--the various DOS 2 clones each handle enhanced density differently resulting in various degrees of incompatibility with each other.

By the way, "DOS 2 clones" includes the FMS built into PaperClip
and SynFile.

Hope this helps.

John

> pin Amphenol Blue Ribbon (the standard "Centronics" connector)
>
>
Actually, I think the reason for the cassette port was, as it was on other computers, the incredible cost of disk drives (along with all other computer hardware). My original TRS80 cost $1000 (1979 dollars) and came with a whopping 16k RAM, a cassette tape recorder and a cheap B&W TV with no tuner. Adding a disk drive to save a whole 80 or 90k per disk would have come close to doubling the cost. I believe the early 256k IBM's with 80k floppies cost over $3000 (US).

The 8088 is not an 8-bit processor--it is a 16-bit processor with an 8-bit data buss. The 8086 is essentially an 8088 with a 16-bit data buss. I think IBM's choice of the 8088/8086 was based on its ability to address past 64k and to run CP/M software which was based around another 16-bit by 8-bit processor, the Z80. Cutting data buss width to cut cost cannot be blamed on IBM--the chip manufacturers were responsible and not just Intel, Motorola did the same sort of thing with the MC68000 i.e. an Atari S(ixteen)T(hirty-two) or an IBM 386-SX both have 32-bit CPU's with 16-bit data busses. The trend continues to this day where you see 64-bit CPU's with 32-bit data busses.

Why would one ever need a "Centronics"connector anyway? Assuming the IBM uses an Intel-compatible equivalent to a 6520 or 6820 chip you have, at most, 16 data lines, a +5v and a ground line, and the rest of the lines are available for control (the 6520 only has 4 of these). I would opine that IBM made the right choice with the DB-25; it was Centronics who engaged in pin "overkill"--if you check the parallel hookup data for a "Centronics-compatible" printer, you find that only 17 lines are used for anything other than ground.

It's fun to knock IBM for a lot of things such as requiring 8-bit compatibility and thereby to some extent crippling their later machines, but they do make good and reliable hardware; so good that the original

Power Mac's used an IBM-designed CPU which was licenced to Motorola.

Yeap, Ataris have problems with enough bits on several occasions. For
instance, fine scrolling on an Atari involve 7 individual single bit
scrolls, followed by a full chr. Sort of makes sense in that case, but
having an larger register would have made it a little easier.

Ather minor annoyance is the limits of the Antic in that it needs
another load of memory location after 4k chunks. That is, the internal
counter for the Antic chip rolls over. 1/2 way through the Display List
instructions for an 8k screen, you have another load screen memory
location that is exactly where the previous 4k left off. Would have been
nice, particularily in Antic's case to add another bit here or there.

> the way they handle the actual bitmapped data, with UIFLI riding on the
> leading edge of Commodore graphics capabilities.
I don't doubt this, I just am not a real fan of some of the techniques
used & the results I have seen on the Atari. For example, I think people
have done at least 4096 colors on the Atari, but by using techniques
like interlacing several screens worth of data. They look ok, but kind
of shimmer a bit too much. I kind of suspect these images have the same
problem on the C64 as they do on the Atari. For instance, uncompressed
file length is usually over 24k!
For me, trying to cram all of your resources into something like number

of colors is like spending so much on your car that there is no money left over for you to buy gas.

What it all boils down to 8k max of display memory on either the Atari or the C64, each with their own styles of displaying it.

Sprites are a stronger then P/M graphics, but Atari can produce some prettier playfields.

Cartridge Control is an address decoder output for, I think, addresses
$D500-D5FF. Some bank selected cartridges used it to address more than
16K. Phase 2 Clock is the 1.79 mhz CPU clock, and it isn't needed
for most cartridges, which only contain ROM or possibly some static RAM.
The clock signal might be used by more complex devices such as the MIO or
Black Box. An 80 column video interface might use it, but it would
probably have to multiply the frequency by 2 or 4.

I assume $D021-$D024 are the playfield color registers? (I'm currently
unable to locate my MAPPING THE C-64 book.)

I was with you up to here, but no.

IF you really want to, you can even mix different display modes on the same line just by banging the registers really hard. That is *IF* I wanted too, I could mix several type of graphics mode on the same text line bye having the 6502 handle the display vs letting Antic GTIA do all the work.

Pretty trivial to do the DLI thing for a bit map mode. Maybe 4-5 intructions, no loops, no cycle counting. Just push any registers you use, store the new shade in the color registers, pop & RTI.

When you start to get into redefining chr sets for the huge 3d effects like Rescue On Fractilus intro screen, shading, changing chrset pointers multiple times as you go down the screen, etcetera, it just plain gets to be much more hassle then it is worth. That is, not easy. I can't even concieve of someone thinking it is.

But then if you can post an example of shading like is done with the Lucas games, I will concede the point. I may even let you throw a 1k redefined chr set in there to give you some room to compete.

The owners of Apple and Atari didn't need to buy new drives to get
that capability, simply get a new DOS disk. That's what I keep trying
to make some people understand about the flexability of a disk based
DOS.

Actually, the Atari does NOT load DOS from ROM (except SpartaDOS X and
the like). The Atari generally loads DOS from disk. The Atari does
have a core OS in ROM. It is similar to the idea of BIOS in the PC
and DOS loading from disk. The Atari OS is very similar in function
as BIOS on the PC. The Atari's OS only acts to let the computer be
smart enough to be able to load in the DOS and provide a common
interface to the hardware of the machine (just like INT calls to BIOS
on a PC). The Atari can also totally discard or replace the OS ROM
routines (XLs and later) by banking them out and using 100% disk
loaded routines for Disk OS or plain OS. That in fact is precisely
what a "translator" disk for the XL/XEs does to give it an OS like the
400/800.

jmelbo@pressenter.com says...

> I have a few things to say.
> 1) The notion of viruses is irrelevant to the value of software
> bootable DOS vs. locked in ROM DOS.

Not irellevant. You can't put a virus into a ROM, but you can install one
under the camouflage of a "bootable" DOS.

> 2) Viruses do not need to be boot sector types

Didn't say there were no other kinds of viri, but this is one more gap
for a virus to hide.

> 3) There is not even one reported case of a virus (boot sector or
> otherwise) for the Atari8 that I am aware of.

..what does not mean there is none. I'm in the C-64 world for over 12
years now and I've only heard of 3 viri and I actually SAW one only (that
one was a bitch!). I know a LOT of people who haven't ever seen or heard
of a virus on the C-64 until I showed them the facts. You're not
omnicient. The fact you don't know of a virus does not prove non-
existence.

On the other hand I could say I saw a man walking over water and you
could never prove a non-existence.. (the kind of argumentation militant
chistians use). In this case It was up to me to prove the existence of a
boot-block virus on Atari.
I won't try this, but I can tell it is a common technique to hide a Virus
in anything that is booted. Like a software-DOS, booting apps, device
drivers (on PC), etc.
Of course this is not the only place to hide viri - I never said it was.

> 4) A software based DOS is superior to a locked in ROM one, because it
> is easier to upgrade or replace altogether with something totaly
> different.

Is it so hard to unplug and replace a ROM-chip that's in a socket?

Source record: 55203

Yes, it's true! Remember those fantastic Atari 8-bit "text movies" popular on BBS's long ago? They were called "Break Messages". Long before there was an Internet or even ANSI, you could do fastictic animated online graphics on your 8-bit with nothing but a simple text editor! Many of us even made "full-length" movies that were a couple of minutes long.

Well, my website, The "Break Movie" Warehouse, is dedicated to those old movies, but until now the only way to play them was to download them and watch them offline using a 400/800/XL/XE or emulator.

Now, see the ONLY online java Atascii player on the web! FIFTEEN MOVIES for your viewing pleasure! And if you don't have java, they are available in animated GIF format as well!

Drop by, then tell your friends! The ULTIMATE 8bit movie site... of course... it's the ONLY 8-bit movie site. :) -*- Tom -*-

The "Break Movie" Warehouse

I'm a nit pickin anal retentive bastard sometimes but I have to say
that you're wrong. When one says "millions" the unit referenced is
million. Fractional parts of that are not the referenced unit. The
reference unit must be considered in terms of integers when used in
general speech like that. For example there was a computer club
meeting and 14 people attended, would you reply to someone asking you
how many were there with an answer like "DOZENS?" Hell no. It would
be an untruthful statement. I submit to you that in natural
language, plural is defined by two or more, not simply greater than
one. Better think before you defend stuff like that because you only
make yourself look funny.

You are certainly correct about different metals in contact,
especially with a current flow present causing stuff like that. I
think the best cure for that is to remove chips from their sockets and
put them back in. It helps to spray electrical contact cleaner in and
on before putting the chips back too. The mechanical friction of
removing and reinserting the chips tends to scrub off some of that
crud and also seats chips which may have "crept" loose due to thermal
cycling.

Actually Apple used the different sector size thing long before CBM
did, if my info is correct.

Atari of course had lame 90K per disk side.

"Different sector size" thing? If you mean differing speeds at different
tracks/distance from the drive head, that was a Commodore invention, and they
guarded that patent jealously.

> The 1581 supports subdirectories, and has 808K storage on 2D/2S 3.5" disks

Uh, no. The 1581 supports partitions. A crummy "type" of SD, if you
wanted to look at it that way.

When I think of an SD, I think of something that is controlled by the
DOS itself. Not by a bunch of direct access commands by the user, IE:
Sending the actual binary numbers to the drive to specify start/end
track's for the partition.

Are you trying to use DOS 2.x for this? To access very large
hard disk images, you will need Spartados or MyDos.

OOOPS, forgot to add Avalon Hill software.

If you see anything you want, need, etc MAKE an offer. (I prefer not to
set prices.)

If anyone wants to make an offer on the lot, go ahead....
people won't laugh at you (though even your pet anaconda may
shun you!)

BUYERS will be responsible for all shipping/handling charges.
Sales to contiguous US only. (No, you don't have to spread a
disease...) On second thought, if you're willing to pay for this
stuff and you live in Botswanna or Brigadoon or Mogadishu or
wherever, yeah you can buy it. I draw the line at selling to the
White House... at least until I see the color of its $3-dollar Bills.

Atari Games for Sale

(All complete with boxes and documentation, unless otherwise noted)

CARTRIDGES
~~~~~~~~~~

**Atari

c Centipede Zap the worm and all his parts. Arcade
game.

**Imagic

c Atlantis Missile Command under water.

c Demon Attack Space Invaders with flapping wings.

**Spinnaker (once again, nice but heavy premium plastic packaging)

c Fraction Fever Shouldn't 98.6 be 98 3/5 ?

c Story Machine Kind of a "mad lib" for your kids.

**Thorn EMI (Once again, neat little BETA boxes)

c Kickback A soccer-like breakthru game.
Did I mention soccer is like unto
great gasping intakes of air!

c Jumbo Jet Pilot Take your seat at the controls of
a jumbo jet. Fly it upside down...
see passengers grab for Gravol...
~~~~~~~~~~

mess up the President's $200 haircut..
console Bobby because they shot his
dog before boarding.... JUST KIDDING!

DON'T TELL *ME* YOU HAVEN'T HEARD 5-1/4" FLOPPIES MAKE GREAT VALENTINE
GIFTS!!!!

5-1/4" diskettes
~~~~~~ ~~~~~~~~~
**Activision

d Master of the Lamps Riddles of music memory and color,
album type packaging

**Atari

d Caverns of Mars Primitive Zaxxon in a Martian cave

**Atari Program Exchange

d Seven Card Stud Monty Webb's poker game. Ziplock
packaging.

**Avalon Hill

d Divex Another darned "teach your kid" number
stuff... don't YOU ever sit down with
him??

d Midway Campaign Win the naval battle in the Pacific

**CBS Software

d Success With Math: Math for grade levels 5-8
Fractions

d Success with Math: Grade levels 7-11
Linear Equations

d Success with Math: Grade levels 9-12
Quadratic Equations

**Cosmi

d The E Factor Save your planet against mimes, aliens
and asteroids!! Sorry, Marcel, oops,
that's "Mines"

**DataMost

d The Tail of Beta Lyrae Lyrae is blow up the spaceships you
missed before. Ziplock

**EPYX
~~~~~~

d Temple of Apshai Base for other DUNJONQUEST games.
Includes both cassette version and
5 1/4" disk.

d Upper Reaches of Apshai Another expansion module for Temple of
Apshai. Book of Lore missing.

**Spinnaker (Heavy plastic box packaging...nice, but probably
expensive to mail !)

d Kinder Comp Collection of six educational games.
Boy, are your kids going to be smart !!

**Thorn EMI

d Home Financial Management If you buy all the above, this will
help tell you how much over budget you
are!!

**Walt Disney PC Software

d Mickey & the Great Outdoors If your kid can only learn from a
mouse, this is the one to do it.
More math and literacy skills.

DID YOU REALIZE THERE IS A RUMOUR CASSETTE TAPES MAKE EXCELLENT KINDLING!

Cassette Tapes
~~~~~~~~ ~~~~~

**Avalon Hill --- I really liked some of these!!!!

t Andromeda Conquest Multi-player game for the control
of the galaxy(Commodore & TRS versions
also on tape)

t Computer Football Strategy ATARI version wasn't at all like
board game... I thought it was better.
(Comm. & TRS also) Nice review of
early Super Bowl teams in rulebook.

t Empire of the Overmind I do remember loving this game...
but times were simpler and so was I
Includes great 'parchment' poem
(Apple & TRS also)

t GFS Sorceress SF adventure game. Nice production
Attractive Mission Manual and a
Storybook were game aids. (Apple &
TRS versions too)

t Legionnaire Perhaps my favourite game of all Atari.
The background book on the Romans and
Barbarians alone is worth reading.
The drone of Roman drummers will either
inspire you or drive you to fall on
~~~~~~~~

your sword. Designed by Chris Crawford
of Eastern Front fame. Maybe I still
don't want to sell this one!!!!

t Midway Campaign cassette version of same as listed
above with diskettes(Apple,PET, & TRS
included on tape)

t Voyager I Really early monster maze game.
Laughable, but it's value is to
remind us of the primordial cyber
ooze from which we were spawn.

**Cosmi

t Aztec Challenge Seems to be "Mountain King" type game.

t Caverns of Khafka typical cavern-tomb danger graphics
game

t The Crypts of Plumbous A lot like "Defender", as I recall.

t Forbidden Forest Find your way out of a deadly graphic
forest

t Galactic Avenger "Space Invaders" type game

t Slinky You've played with the springs, now try
them on the screen!!

t Spider Invasion Destroy deadly spider mutations, their
eggs and nest. Are you getting as
itchy as I am?

**Edu-ware Services

t Compu-read 3.0 Tool for improving reading speed and
comprehension. NOT boxed, but in it's
own folder including docs.

**EPYX

t Curse of Ra Expansion module for "Temple of Apshai"
adventure game. Book of Lore missing.

**Program Design, Inc.

t Addition with Carrying Math games for the young. In clear
plastic sleeve.

**Thorn EMI -- love their packaging....beta-like plastic containers
(and we all know where beta is)

t Compute 4 & Reversi Connect-4 game and "Go" type game

t Cribbage & Dominoes Cribbage & Dominoes...get the idea?

t Darts So safe, you can even throw them at
your Mother-in-Law

t European Scene Jigsaw Like those plastic toys where you
Puzzles Vol2 slide the tiles to get the picture
together.

t Figure Fun Two games to teach multiplication,
division, etc. Five levels, cover most
ages

t Pool Everybody in the Pool !! No, not that
kind -- tournament and eight-ball,
practice included.

t Snooker & Billiards Pool with fewer balls and no numbers.

t Super Cubes and Slip Rubik's Cube and marble maze in
computer form.

Books and miscellany

Cross-posted to: alt.c64,comp.sys.atari.8bit,comp.sys.cbm

I got a lot of my information from a retired IBM engineer a few years ago. I was in one of the the local computer shops when the owner told him"NOBODY" in the world would have parts to repair his original five slot PC, so I offered to help him. When he gave it to me he told me he was on the design team, and it was out of the first production run, and they gave it to him when he retired. I changed the floppy controller card and charged him $10, and he had tears as he picked it up, then sat and told me a lot of the history behind the project. I've seen a few of the IBM products using the bords that ended up in the PC, including the sheet metal (I worked a place that recycled tractor trailer loads of mainframe and business equipment for a couple years)

An old issue of BYTE magazine had some pictures of the prototype motherboard, and it think I still have it boxed up somewhere.

CPM was written by Gary Kildall (not sure of the spelling) when he worked at intel, and was for the 8080 family of 8bit processors. He left Inte and started Digital rResearch to develop CPM into a widwly accepted OS. Then IBM wanted him to ignore his other contracts to port CPM to other manufactures machines to develop CPM16 for them. He sent them to Microsoft who had bought MSDOS for a programmer in the northwest US, but it had limited commands and didn't support hard drives

More later, if anyone is interested

Source record: 55218

This looks like the appropriate thread so I'll throw in my question. I would like to replace a rom in a socketed cartridge with a dram. What kind of dram will work best with the fewest modifications except for the read/write line, etc? I'm going to cut the ram package down the side to expose the chip, which will allow me to use it as a crude digital camera. That's why I need to use a dram but I won't need to refresh it when I'm done getting the image.

Thanks,

Patrick Robbins

Heh Heh...

Yes, you guys are right... If a basic Gr. mode 1 was used, the entire character would be a display line, so you couldn't sub-divide it and use DLIs to shade it.

From foggy memory.
> So if I used CARTCTRL, with the additional address lines I would be
> remapped to the $Dxxx area.
Not exactly, CARTCTRL is a line that goes low on any access to the
$D500-$D5FF area in the hardware region. I think I have that right,
Pokey is $D200, PIA is $D300, yeah, what the hell, $D5xx sounds
right<grin>.

That is, when every you do anything in the address range of $D1xx, that
line goes low. [STA $D51F, LDY $D5FF, LDA $D590] would all cause this
line to go low.

The Atari memory map has holes in it. I mean everyone can accept in a
16k Atari, there are some areas between the bottom of memory & the end
that have zilch there. Doesn't matter if you think it is a good idea or
pie in the sky future expansion, but Atari has several areas with holes
in it in the hardware region. I like it myself. Holes IIRC are $D1xx,
$D6xx, $D7xx with the $D1xx used by the devices like the MIO.

>If I used SD4 (?) or SD5 (?) where would
> that put me? They seem to go to the CS lines of the EPROMS (27C32)
> that are in there.
I think these are just equivalent to !CS lines to get the full 16k you
can put in a cart addressed. That is, SD4 is would be tied to the !CS
pin EPROM you want to be enabled from $8000-$9FFF, SD5 would be tied to
the equivalent pin for the EPROM that goes from $A000-$BFFF. I will have
to check if they are active high<CS> or active low<!CS>.
>
> Thanks again.
>
> Tony
What is done with bank switching carts is they employ a couple of 74LSxx
chips. I believe the OSS Super Carts just used a 74LS74 to latch the
equivalent of bank select lines.
In practice, you just combine the CARTCTRL line with the Phase 2 clock
signal with something like a NOR<?> gate, & use that to generate a clock
pulse for the latch. The latch then supplies the extra address bits. I
have a circuit I designed around here somewhere. I will dig it up.

So, let's say you have enough lines to address 16k w/o any tricks in the
Atari. Let's also say you want to put 32k worth of rom in the cart. One

way of doing it would be to combine the CARTCTRL & Phase 2 clock lines to generate a clock pulse for a 74LS174. The '174 is a 6 bit flip flop, ability to latch 6 bits of data. You would tie the D inputs of the '174 to the data lines 0-5. The outputs of the '174 would be tied to your extended carts Address lines.

Something like:

data buss =>74LS174 =>ROM address lines above the 1st 16k
Address buss =>ROM address lines in the first 16k
S4 & S5 tied or combined OR fashion if need be to the appropriate CS lines of the ROM.

Write a 0 to the hardware region, like LDA #0, STA $D500 and the rom addresses for the first 16k will appear in the memory wind of the cart i.e. $8000-$BFFF.

Write a 1 to the hardware region & this will toggle the first address line above the ROMs first 16k such that now you will see ROM locations 16k to 32k in the cartridge address space of $8000-$BFFF.

1588. FREE Atari Catalogs by E-Mail, FTP & the Web! Free Atari stuff!

Please direct all replies through E-Mail to bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I do not regularly read NewsGroups.

I have some stuff to unload. I have a lot of Atari Magazines. For the person who takes the whole lot. Some including disks. I don't want to have to go through them or sort them out. I just want someone to take them off my hands for the cost of Shipping. Classic Atari 8 Bit & Atari ST. I also have some Atari Hardware that doesn't work that someone can have for spare parts or tinker with to try to repair.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my Desk-Top Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can load them into your text editor or Word Processor and view them, edit them or print them out! It would make things easier if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend. Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Depends on what the C64 power supply puts out. The Atari eats +5vdc and
needs up to 1.5a.

The power port on the Atari is a 7-pin DIN. Looking into the port, the
pins are:

7 6 Imagine this is a circle with a groove at the top
3 1 Pins 1, 4, and 6 are +5vdc
5 4 Pin 2 is shield (ground)
2 Pins 3, 5, and 7 are ground

If you learned the real "Queen's English", "ground"="earth" :)

DOS 1.0 was pretty much a variant of CP/M, which isn't much compared
to modern operating systems, but it wasn't unusable. The reason the PC
had a cassette port was because disk drives were still expensive in
the early 80s.

> Also, the PC was built in a IBM word processor case because
> their "Market research" told them the whole world market was under 1000

Do you have a cite for this? When the IBM PC came out, there were *a lot*
more than 1000 Apples, PETs, etc. on the market.

A program for the 64 called Metallix (I think, appeared in Compute's Gazette)
was simply well-timed. The character set was reversed out. Then, interrupts
disabled, the program sets the background colour for one screen line, waits
out the full 65 cycles, sets the background colour for the next line, waits
out the full 65 cycles, etc., all the way down the screen. Since the font is
reversed, the background colour appears to be the text colour of the letters.
Net result, individual colour per scan line. No sweat.

You'll get no argument from me. The Atari sprite system is just plain
primitive (in relation to C64 sprites).

>>OK, this is where I disagree. I will say it is a straight trade off.

>picture? Which is more useful?

Few Amiga programs (ie. games) take advantage of 64 color mode because
it slows the system too much (I believe effectively making the
processor run at <4 Megahertz). In fact, a large chunk of Amiga games
use only a 16 color screen (for the speed) and use Copperlist fiddling
to change the colors in midscreen. Also, use of the Amiga's sprites
increases the number of apparent colors on the screen (Atari ST's
don't have sprite capability).

>I reckon I'm beating a dead horse here, but, as a programmer, I have

Wish the Atari had color RAM...but with the provision that it wasn't
limited to a ludicrously small 16 color palette. YUCK!

Programs have to take advantage of the hardware they're written on.
Certain C-64 games translated to the Atari would look like shit.
Certain Atari games translated to the C-64 would also look like shit
(especially those that took advantage of GTIA 3D shading modes).

>I think you'll agree, however, that the 64's timers are significantly
>more powerful and flexible. Not a huge advantage, perhaps, but a

Hello, I recently found a lot of sites to play Atari games for the pc. AR the city/dungeon to be exact. I am having trouble getting these to run properly, I can start the game fine, once they ask for another disk (City once you walk through the opening portal/Dungeon entering Shop), I do not know what to do. I try to hit all the keys, but to no avail.

I would appreciate all input on this, I accidentally threw out my AR real game, and I curse myself everyday because of this. I thought there was no way to solve it after you arrived at the Gargoyle. I had no answers to give for those silly riddles, but now that I found them on line, I want to finish the game.

I have read rumours about releasing those games again? I wander if that is true.

Thank you everyone in advance

Kenn

It's been awhile since I looked at Fort Apocalypse. If my memory is
correct, the the shaded text displays were definitely done in a
hardware text mode.

WRONGO!! On the Atari, iIt's just about as easy to create shading
effects in text mode as it is in graphics mode.

>I think the maximum a human eye can percieve is about 16 shades of grey.
>Thousands of colors of course, but our grey scale doesn't use enough
>bits.

ABSOLUTELY WRONG!!! I worked in the special GTIA 16 luminance mode and
could definitely see the color contours created between two
luminances. Heck, on the MAC I could see the same contour effect with
256 shades of one color!!!!

Sadly the version on my site isn't NTSC, but check my game Reaxion. It uses the same trick to do what Tony was talking about (running on a raster) and, using a 2x2 character font, does a nice chrome effect too. =-)

For an improved effect, the C64 can quite happily do different sets of colours per character line simply by going into extended colour mode and splitting $D021 to $D024. This means that it's possible to have a text line with a blue fade, brown fade and rolling rainbow colours with each character using any of the effects.

Oops. Forgot about the fifth grey level. Just confirmed it on pages
646-647 in COMPUTE'S MAPPING THE C64.

For some reason, the info in this book switches the colors for numbers
8 & 9 (brown & orange).

I believe Jason means the following: (Please note that the following
is bound to have some minor mistakes concerning the specifics of the
C-64 hardware. Therefore, I welcome any corrections.)

The normal C-64 text mode displays each character in an 8x8 grid of
dots. Each character contains two colors: forground and background.
the background color of all the characters on the screen is controlled
by a hardware register ($D020?). The forground color of each character
can be separately defined by a special half kilobyte of color RAM (one
half byte, or nybble, is assigned to each character). To produce an
Atari-like rainbow effect where each individual scanline contains a
separate color, manipulation of the special color RAM is (normally?)
unfeasible. Instead, the characters would have to be reversed (every
"on" dot would be "off" and vise versa) so that the color register
($D020?) would now control the forground color of all the text. This
register can then be manipulated via RASTER INTERRUPTS to produce the
necessary scanline color changes. The unfortunate aspect of this
technique is that the coloration of the characters cannot be
individually defined. The technique in the following paragraph
circumvents this problem.

By selecting MULTICOLOR MODE, the C-64 video hardware can support a
way of being able to have three separate rainbow effects at the same
time. In this mode the resolution of the character cells is cut in
half (4x8 grid instead of an 8x8 grid). Now each double-width dot
within the character cell can be any one of 3 forground colors which
are controlled by three of the color registers between $D021-$2024. A
redefined character set (requiring 2K of RAM memory) can now be set up
to produce 3 sets of letters, each controlled by a separate color
register.

A fourth forground color can also be displayed by setting another register in the $D0xxx range (don't know which). Unfortunately, there's a trade off. Only half the number of separate characters (128 instead of 256) can now be displayed. Why? Normally a character is represented in video RAM by one entire byte. In this special mode the high bit (of each byte) is used for flipping on a fourth forground color which is controlled by the fourth color register in the $D021-$2024 range. The 7 remaining bits (having 128 distinct combinations) now control which character should be place on the screen. Now we have the ability of having 4 separate rainbow effects.

The Atari's also support the above methods for displaying rainbow text.

Euhm... Not really.

In addition to multicolour mode, the C64 also supports "extended
character background mode", which only works in textmode. Basicly,
the two uppermost bits of the respective byte in video memory describe
which of the 4 possible backgrounds is selected. Ofcourse, this means
that you're stuck with only 64 possible characters.

These 4 backgroundcolours are stored in $D021-$D024.

Now, if you reverse the font, the background peeps through. If you
change those 4 colours every scanline (Not with a raster interrupt -
timing the darn thing works better), you can change the colour of
the characters every scanline. Note that you're actually changing
the background colours, but since the font is reversed, you end up
with a shaded character.

Since you can select 4 different backgrounds for each character, you
can have 4 different shades on one line.

No need to lower the resolution.

Tradeoff: Only 64 possible characters.

>Cameron:

In the C-64's normal text mode, all 8 bits of each byte in the text
display buffer is used for character definitions. This means a total
of 256 possible characters can be displayed. The background color for
all characters is the same (this color being defined by color register
$D021).

In the C-64's Extended Color Mode (ECM), 2 of every byte (in the text
display buffer) are used for changing the background color of the
character (these four colors being defined by what's been placed in
the color registers $D021-$D024). Since only 6 bits are left for
character definitions, then only 64 characters can be displayed
(without using Raster Line hocus pocus).

Is this correct?

Well, yes. I assume by "hocus pocus" you mean turning ECM on and off. There
are some VIC-II settings that don't work this way; bit 4 in $d011 comes to
mind.

Because of the 64-character restriction, ECM is rarely used. The only thing
I've seen it in is COMPUTE's old menu system, and now, Retrograde (since I
know what it is now).

>shades.

I assume you mean that the bits within the character definitions are reversed (ie. 1's become 0's and vise versa) so that the background color registers are now "tricked" into becoming forground color registers. Now the color nybbes (which control the forground color of each character on the screen) are "tricked" into controlling the background color of each character.

Now, through the use of color registers $D021-$D024, a maximum of 4 different character color sets can be manipulated via RASTER INTERRUPTS (for 4 different rainbow/shade effects per horizontal band of text).

Is this correct?.

> "bug" are you referring to?
Indeed.

My carefully designed timing went beserk because LDA bla,x had to cross
a boundary. Needs an extra cycle.

>How can I tell whether my Atari 800 contains the CTIA chip (as
>opposed to the later GTIA chip)?

The easiest way is to find a LucasFilm game (KORONIS RIFT, RESCUE ON
FRACTALUS, BENEATH JAGGI LINES, EIDOLON, & BALLBLAZER). All these
games contain an intro display saying "LUCASFILM GAMES." If this
screen is displayed with verying shades of gold, then you've got the
GTIA chip.

Sometimes, if the game is pirated, this initial display screen is
missing. If so, then try the next tip.

Another way (to check for a GTIA chip) is to find LucasFilm's KORONIS
RIFT game, which almost exlusively uses GTIA modes.

The display screen in Koronis Rift is split into two sections: upper
and lower. Check the lower section. It contains a holding area for
collected items. The background of this holding area should be shaded
with multiple gray levels. If it is, then the computer has the GTIA
chip.

If this doesn't help, then respond again and I'll come up with another
way to check for the GTIA chip.

> ignore his other contracts to port CPM to other manufactures machines to develop
> CPM16 for them. He sent them to Microsoft who had bought MSDOS for a programmer in
> the northwest US, but it had limited commands and didn't support hard drives

Not exactly true.
Kildall wasn't in his office as IBM-people showed up to license CP/M. His
mate refused to sign a "keep secret about everything said here"-Contract
that IBM required before discussing anything, as he thought he wasn't
authorized to do this. So the IBM Guys went off and the first company
they found that SAID they had an OS was Microsoft, who (for real) had no
OS at that time. Gates bought the QDOS (Quick and Dirty Operating System)
and relabeled it MS-DOS and sold it to IBM... the rest is history I have
to deal with at the moment ..grrr..

At least this is what the Book "inside Intel" says.

As far as I know Commodore calls it "Extended Background Color Mode (EBC
mode)".. so both of you are right.. but a bit lazy :)

There is a much easier way to find out if your machine contains the GTIA or CTIA chip. In BASIC, type the following:

POKE 623,64 (RETURN)

If the screen stays blue, you have the older CTIA chip. If the screen turns black, you have the GTIA chip. Simple, really.

More information, as promised last week:

Event: The 1999 UK 8-bit Convention UK8

Where: The Saddlers Club, Walsall, Nr Birmingham, England

Date: Sunday, September 26th 1999

Times: 9.30 - 5 (bar open from 12 - 3.30)

Cost: £2 per person admission (by ticket only).

Tables bookable (*probably* up to 40/50 available): £5 each. Priority will be given in the following order; (1) clubs and magazines (2) commercial suppliers/supporters (3) individuals.

Any profit left over at the end will be put back into another event next year. Nobody is getting a wage out of it!

Awards will be made to the best exhibitors in various categories on the day.

We expect it to be a sell-out, but send *no* money yet, bookings will open at the end of March (NB: this is *not* an April Fool!)

Food facilities available: various, including a McDonalds, are nearby. Or bring your own food. There will be a comfy sit-down and chat area.

For a further information as it becomes available e-mail uk8@spheroid.demon.co.uk or write, enclosing an A4 stamped addressed envelope, to Brian Watson, Harrowden, 39, High Street, Sutton, ELY, Cambs CB6 2RA, England.

It would be appreciated if this information could be passed to any user groups, fanzine editors or commercial supporters who might be interested in attending.

We hope it'll be a good "do", and the first in a series if it works.
Nobody's taking a cut of the takings above and beyond properly accounted
legitimate expenses, so there should be a surplus to carry forward into next
year.

If it does fall flat on its face, and that doesn't seem likely as I've
already got thirty people on the e-mailing list before news has got into any
of the printed or disk magazines, the IEBA and WACCI are co-underwriting it.

There's plenty of room for fanzines, clubs, and small publishers to take a
table and we hope the prices are sufficiently attractive to ensure an event
that makes a day out to it worthwhile.

Nearer the time, I'll open a "lifts wanted/offered" service for those who
want to use it.

You're right. Being an Atarian I couldn't understand such technical
issues. After all, I'm only used to HUNDREDS of colors, DOZENS of
display modes, individual sprites consisting of HUNDREDS of lines of
data and a processor that runs at MILLIONS of clock cycles per second.
Oh, and unlike a C64 user,I don't have to type HUNDREDS of keystrokes
to run a damn program. =-)

Yes, a disk based DOS is definitely flexible. But for 64K (and under)
computing, a ROM based solution, which leaves more RAM for apps, still
has major advantages. For example, the Apple's ProDOS operating system
was probably the most powerful DOS for an 8-bit computer.
Unfortunately, on a 64K system, ProDOS ties up almost half the memory.
(28K?)

I believe Apple's Mac was the first Apple computer with a disk format
containing varying sectors per track. The first Mac was produced in
1984. The Commodore 1540/1541 disk drive dates back to 1981.

BERZERK? I assume crossing a page boundary caused an INTRUDER ALERT!!!
=-)

Why was such stringent timing necessary? Stuffing four color registers
with a new color every scanline shouldn't have caused that much of a
problem. Doesn't the C-64 video hardware give a program a way of
synchronising with the scanlines? The Atari 8-bits have a special
register (WSYNC) which freezes the 6502 until the current scanline is
finished. This allows for a clean color change to occur from one
scanline to another.

Yeah! I realized my mistake 10 minutes after sending my previous

message.

Did you know that such a thing (high res multiple color text on the same scanline) is possible with an Atari? The technique has some restrictions, though.

The Atari video hardware only supports 1 1/2 colors in high-res text (ie. the forground can be set to a different luminance of the background but both must have the same hue...as in light blue & dark blue or light red and dark red).

Player Missile graphics can be set to quadruple width so that each PM dot is as wide as a text character. Placing all 4 players (at 8 bits each) and 4 missiles (at 2 bits each) in sequence can produce full screen (40 column) coverage. The playfield/PM priorities can then be set so that the Players and Missiles "hide" behind the forground color of text. Now the text can be reversed, the background playfield color register set to zero (for black) and *VOILA*, the color of the individual text characters can contain either the color of the corresponding PM color register or (if the corresponding PM pixel is set to zero) the original background color.

Since each Player has a separate color register, each 8 character "zone" (or 10 if the missiles aren't combined to form a fifth player with its own color register) can contain a different "secondary" color. For more color variation, one can stack two players on top of each other. This later technique limits coverage to only half the screen (20 columns as opposed to 40) but allows for the introduction of 4 complete color variations within an 8 or 10 character zone. (the first color coming from the original background playfield color register, the second and third from the corresponding Player color register, and a mysterious fourth color produced by turning on both Player pixels on top of each other).

DISPLAY LIST INTERRUPTS combined with the WSYNC register can then be used to produce intra-character rainbow effects. Again, if PM graphics are stacked for more colors, the Atari method is more limited than the C-64 method in terms of coverage (half screen as opposed to full screen). However, the Atari's larger choice of colors available for RASTER manipulation (128 minus 16 vs. only 15) should offset the initial shortfall. Another Atari plus is that 128 characters are available (as opposed to the C-64's 64 character limitation).

Lots of variations of the above techniques can produce some interesting effects. The horizontal placement of Players and Missiles can be moved around via DISPLAY LIST INTERRUPTS in order to break the stationary 20 character limit, stacked Players and Missiles can be horizontally offset to produce multicolor effects within individual text characters, and, with exceedingly careful timing, Players can even be re-used within individual scanlines.

The above information is based on my own personal experimentation with an Atari.

You can trigger an interrupt on a specific scan line, but this isn't useful
where you have to trigger the IRQ scanline after scanline. Much more useful
to simply wait out (in Martijn's case) 63 cycles, and then you *know* you're
on the next scan line. For me, I would be waiting 65 on an NTSC unit.

I understand the C-64's additional overhead (in relation to the Atari)
in producing a RASTER INTERRUPT on every line. But blind scanline
timing seems to be a bit too primitive (and inaccurate). If the C-64
doesn't have a hardware method comperable to the Atari's WSYNC then
perhaps a C-64 program could simulate it by constantly reading the
raster register for the raster line change and then immediately update
the color registers. Unfortunately, setting up this testing loop may
consume too many clock cycles to be of importance. =-(

You'd have to be careful with this method because earlier versions of
BASIC (or was it the OS?) do not contain support for drawing in the
GTIA modes. Also, since the Atari 800 required a separate BASIC
cartridge, you're not guaranteed it will be included.

aarona@/REMOVE/localnet.com says...

> >That's fifteen colours. You do mean thirteen colours and three grey shades,
> >don't you?
>
> Actually, the C-64 supports 12 colors, 2 gray shades, white, and black
> (believe it or not, most computers support the last two =-))

0 black
1 white
2 red
3 cyan
4 purple
5 green
6 blue
7 yellow
8 brown
9 orange
a light red
b dark grey
c medium grey
d light green
e light blue
f light grey

That's 5 grey shades (including white and black) and 11 colors.

Aaron:
> I assume $D021-$D024 are the playfield color registers? (I'm currently
> unable to locate my MAPPING THE C-64 book.)

No, they're the standard and extended background colours. In ECM each
char can have one of sixteen colours as usual and one of four background
colours set by $D021 (the normal background colour) and $D022 to $D024.
All four can be split every rasterline.

Cameron:
> Extended colour? Is this like extended background mode or no?

Well, that's the other name for it but I've always referred to it as
extended colour mode 'cos the guy who showed me how it worked called it
that. =-)

> And what do you mean by "splitting $d021 to $d024"?

Same as the Compute program you mentioned, set a colour, wait for the
next line and set another. Just do all four registers.

Check the titles page of Retrograde by Apex (the highscore table) for an
example.

Hi Larry,

Actually Steve Tucker has the APE Warp+ OS rom chips which replace
the XL/XE rom chips and increase the Atari transfer speed on US doubler
and other enhanced Atari disk drives, I'm told the speeds can reach
38,400 but your better off checking with Steve at the Atari Peripheral
Emulator (APE) website, I dont have the link available, but do a search
for Steve Tucker and APE and Atari. I'm sure the link will be found
easily.

Thats a debate in itself, if you want a great keyboard, the you want a 1200XL, if its memory and then its the 130XE (very mushy keyboard though), if its classic look with expansion slots then its the original Atari 800, if you want a cartridge slot on top with the ability to use interfaces for SCSI and other drives, then you might want to consider the 800XL. Its a tough choice, they are all great machines, its a matter of taste and preference. If your not too familiar with the various models, then stop by the Atari Historical Society website and go to Atari Personal Computers and Atari 8-Bit computers and have a look and the various models designed and sold over the years as well as many that were never released.

6264 would be real close to a 2764 as far as pin out goes. But it may be
a little tougher then you think. Atari wanted to make sure no one
unplugged a cart, so there are checks in there that may crash whatever
you try & do.

>OS rom chips which replace
>the XL/XE rom chips and increase the Atari transfer speed on US doubler
>and other enhanced Atari disk drives

Hi Curt-
Yes, but this thread is about going beyond
what a 1 MHz drive processor can do using
1 serial line only for transfer. I've actually
always wondered about the figures quoted.
No quest ion that Ape Warp is much faster
than Happy Warp or US, but I've seen quite
a few articles/docs that indicate the SIO speed
of Happy/US is already 55K. Perhaps the
difference lies in that Steve is using more
conservative throughput numbers. (?) The
was an article by Tom Harker some years ago
that went into the stated vs. actual drive
speeds. Back to original idea - some C64
fast loaders use more than one serial line.
There are lines in the SIO cable that look
like they could be used with a little added
hardware (and Rom code change). Also,
as a different approach, I wonder if anyone
has looked at bumping up the drive processor
speed to something faster than 1 MHz. Then
the limiting factor would be 1.79. (and the
attainable speed should be at least 50%
faster.)
Larry

True, I always lable my disks carefully. Or rather I use a system with
numbers and characters. like g010 (games disk #10), d010(demos disk #10),
and so on. And I keep a database in a standard ascii-file, and then it's
easy to find what I'm looking for by just searching that textfile.

Mac drives use a similiar technique, with only one difference: Instead
of changing the bitrate, they change the speed of the drive motor.

Very yucky, indeed.

> you mean by "splitting $d021 to $d024"?

Since he's referring to those colour bars - it's extended background mode
allright. What you basicly do is this:

Invert your character set (the lower 64 characters are 'plain', you
need the reversed set), and store the respective colour for each
of the 4 bars to $d021 through $d021 (background #0 to #3). Use
a black foreground colour, and you can have a textline with 4 different
shades.

The only 'difficult' part is the timing - you'll have to update those
4 registers every rasterline.

Martijn (having written such a routine not too long ago)(and spending
half an afternoon searching for a bug wich wasn't there - page borders
suck)

That is a way. Jaggi lines though did not have that Lucas intro.
Another way would be a system check type utility. I have a few of
such somewhere.

Cameron:
> Well, yes. I assume by "hocus pocus" you mean turning ECM on and off.

In theory you could split $D018 once every character line to get more
characters but in practise, trying to split $D021-$D024 *and* $D018...
=-)

> There are some VIC-II settings that don't work this way; bit 4 in

Demos use it a lot and there are other games (check the status line on
It's Magic). And the old Strike Force writer used to pulse the colours
rather than split them.

John/Lori (henk@spamsuxdoitnow.com) wrote:
: > No computer invented by man has ever done true 3D.

The world _is_ 3D because objects within our field of awareness are both near and far. Our perception of how near or far an object is from us is judged by its height, width, and depth. What makes such a determination possible is having two eyes. The space between our eyes causes each eye to see the same image but displaced. Ever look through a kid's ViewMaster? Like stereophonic sound (sound for two ears), stereoscopic vision is sight through two eyes - 3D graphics. The ViewMaster shows each eye an image slightly displaced from the other and the pictures are very realistic. Virtual reality images generated by a computer display through a viewer with a tiny monitor screen for each eye. Three dimensional perception, if not tangible, is the result. Or so I've read.

Hello,

I have always enjoyed Atari's and I used them devotly until 1993. I just recently found my old atari 8 bit, but I lost most of my games. I just found out about emulators, but I have had no luck in getting them to work. I have downloaded xlit20 and all the roms, and still no luck.

I am trying to get AR the dungeon and Return of Hercules to run on my PC. I would be greatful for any and all information.

Is Return of Hercules the multiplayer game where you had to complete the 12 labours of Hercules, and you could use a lot of the greek heros?

Thanks a lot in advance,

Kenn

Do you know about Microware's OS-9 for the 6809-based Radio Shack Color Computer? *Much* more powerful than ProDOS. Preemptive, multitasking, and modular. See http://www2.southwind.net/~ewy/Microlith/whatsos9.html for more information.

> Unfortunately, on a 64K system, ProDOS ties up almost half the memory.
> (28K?)

Something like that. I never used ProDOS much, because my Apple II was floppy-based. ProDOS was overkill for such a system.

>>
>>-Brix-
>
>The problem is DE-FEET! =-)

No. God you people _STILL_ don't get it. Sure it may be easy enough
to replace a ROM chip _if_ it is socketed and you are the kind of user
who doesn't mind opening up the cases of things (often voiding a
warranty). But some people might want to use an update to a DOS but
not wait until their warranty runs out so they can open their case.
And then there are a lot of people out there who dislike opening up
computer equipment and replacing chips no matter what. Then BESIDES
ALL THAT, where does one get the "ROM" to plug in? The ROM tree in
the back yard? With a modem, you can literally get a new software
based DOS in no time flat with very little hassle, effort or cost.
Plus, software based DOSes are more likely to be updated more
frequently due to the ease of distribution, and along with that there
are more likely to be more of them to choose from available.

It is you who have been defeated. If you can't see it then there's no
help for you. I really don't care about this whole vs. thing, I just
care about the truth. I have readily admitted things about the C64
that I find to be superior to the Atari. Booting capability and
software based DOS & OS capability are definitely a plus for the Atari
over the C64. You live up to the fears of those who think this thread
will turn into a religious thing like the old days by refusing to
acknowledge the obvious.

Yeah, 16 color text is better. Yeah, sprites are better than PMG.
No, ROM based DOS ain't as good as software based DOS. Get over it.

1663. Project: PHOENIX notes

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-03 00:00:00 UTC
From: morloc <morloc@acd.net>
Message-ID: <CdRt2.641$Si.12113@newsfeed.slurp.net>
Source record: 55129
Body handling: HTML body converted to readable text

Project: PHOENIX

Development by: Timothy B. Kline

Logical development: S.T.I.P. (ST.andard I.nterface P.rotocol) modules

Product Design: Cartidge (256K ROM/128K RAM/dual chipset) (estimation)

Programming Language: 6502 Assembly

Supports: TCP, PPP, HTML (text-based)

Machine Requirements: Atari 800/XL/XE, modem

Optional Components: Disk Drive(floppy/hard),printer,mouse/joystick

Introduction: This is a very generalized overlay of the PHOENIX project that I am presenting to the Atari public from the outset to get feedback. This is also a rough draft of the project and will likely become more refined as PHOENIX is developed. Feedback and questions are welcome, as I am new at some of this and will likely have many mistakes, including in my logic. Let PHOENIX be an Atari Users PUBLIC-INPUT project since you are the ones that will be using it.

Modules:

Modules marked with (*) are required to remain in MAIN memory and cannot be banked!

Modules marked with (+) are cleared from memory after they operate.

1. TCPIP*

A. Provides the tcp/ip stack for user.

2. DIALUP (+)

A. Handles connecting to ISP for user, including login procedures. Used only to connect to ISP. All other matters are handled by TCPIP module.

B. Memory freed up by KERNEL after successful connection. Reconnection requires that module be reloaded to run.

3. KERNEL*

A. Browser kernel (OS).

B. Handles com port activity, calls appropriate modules for action after INIT.

C. Maintains HTML buffer for HTML-IN modules.

D. Frees up memory used by INIT module, DIALUP (after connection returns "success"), DISPSETUP.

E. Monitors user's inputs via joystick/keyboard/mouse.

4. HMTL-IN

1.. HTML interpreter (similar to BASIC interpreter which dismisses w/error any HTML code not supported (HTML 3 so far?)
B. Read in HTML from kernel HTML buffer

C. Convert to PHOENIX' display S.T.I.P. format

D. Send converted code to HTML-OUT S.T.I.P. module for displaying

5. HTML-OUT

A. Receive converted code from HTML-IN module

B. Display page, setup any pop-up boxes containing links on page

1) Determines if display is hi or lo res and formats accordingly

6. DISPSET (+)

A. Initializes custom display according to user's selection (hi/lo res)

7. INIT (+)

A. Runs setup routines, reads in from disk any user preferences/settings

B. Sets variables, checks machine's capabilities (RAM, XL/XE?, etc.)

C. Initializes KERNEL and passes control to KERNEL

8. BUFFER*

A. Stores HTML code for processing

9. POPUP

1.. Provides a pop-up menuing system for user to access certain features such
as page links of a web page.

B. Provides a simple help system to user as an "online" guide.

2.. Provides a means to input manually a URL address, in conjunction with the input box of the web browser.
3.. Provides user with a list of available "favorites" from disk file and ability to select one.
10. HTMLED

A. A simple text-based HTML editor for editing HTML files

Notes:

1. S.T.I.P.

1.. S.T.I.P. is designed for modular use to allow for maximum expandability of PHOENIX and to allow for optimal trapping of errors.
2.. Each module interfaces with the KERNEL by using the KERNEL's unique program STACK. The KERNEL module simply initializes appropriate modules. Each module MUST PERFORM A SINGLE FUNCTION, and may access the following permanent modules: STACK, BUFFER, TCPIP.
1.. C. Additional modules can be interfaced into PHOENIX simply by injecting itself into the STACK's command table or by the designer providing a new COMMAND module for PHOENIX which includes his/her module's call-command.
This gives PHOENIX unlimited potential for all its users and a standardized means of expandability. Modules can be set up to run from any available disk drive (floppy, hard, or RAM).

2. BUFFER

1.. Simply put, this is where all html that is received from the web goes. Now, because there is only so much memory available on the Atari 8bit, this is done in the following fashion:
1) html code is received

2) after each "complete" html segment, it is buffered and HTMLIN module is summoned by KERNEL, which processes the code and passes the processed code onto HTMLOUT for display.

example: KERNEL receives an html segment from web page and buffers it thus:

Received:

text

KERNEL's action:

Upon receiving the closure html code "", KERNEL considers this a complete instruction and sends it on to HTMLIN for processing. If there had been no "" signifying closure, KERNEL would have come to another html code and dismissed the beginning "" command altogether.

Fortunately, most html editors on the market will check for errors in html code, so this is unlikely to happen.

This is similar to how BASIC interprets your typing in a command (such as SETCOLOR) and then reacts. Simple, right? Thus the COMMAND module's importance comes to light. Want a new feature? Add a command to the COMMAND table and KERNEL will call it up when it's needed. HTML definitions are located in the COMMAND module in such a way as to cause HTMLIN to react in an Atari-friendly fashion, and HTMLOUT, too.

Now you may ask, what about web pages that contain straight text, such as a textfile, or text that may be found without html tags? Does that, then, just become ignored? No. The KERNEL is designed to recognize that sometimes this is the case and will respond thus:

If information continues to be received from a website, but without any html tags, then it is fed into BUFFER until it becomes full, and then HTMLIN is flagged to dispose of the BUFFER, treating it as raw text, and it will certainly display it as raw text, too! The BUFFER is then cleared and ready to go again. This process continues until an html tag is found or until the web page finishes loading. Again, though, most people will add a tag to their html, so this will work in an html setting. In the case of a raw textfile, the end will be reached and that is, as they say, that. Flagging HTMLIN to act on the buffer as raw text is the ultimate failsafe that you won't miss any information of a web page that is text-based. However, there is no java support, midi support, etc. in PHOENIX unless someone figures out how to write the S.T.I.P. module for it. Sorry!

3) process returns to step 1.

3. STACK

1.. This is a unique system that will provide a means to access various features of PHOENIX.
2.. It provides numerous factors such as FLAGS, online condition (connected/offline), and more.
C. It is designed thus:

1) STATUS TABLE:

STATUS1 [64] [32] [16] [08] [04] [02] [01]

F E D C B A

A- CONNECT ONLINE=255 OFFLINE=0

B- DISPLAY HIGH=255 LOW=0

C- MACHINE XE=255 XL=0

D- CART YES=255 NO=0

E- MODIFIED YES=255 NO=0

F- PATCHING YES=255 NO=0

RAM [64] [32] [16] [08] [04] [02] [01]

1024 512 320 256 128 64

BANK [64] [32] [16] [08] [04] [02] [01]

7 6 5 4 3 2 1

[Bank 0 = 0, Bank 8=255]

STATUS2 [64] [32] [16] [08] [04] [02] [01]

G F E D C B A

A- BUFFER FULL=255 EMPTY=0

B- CONVERT HTMLIN=255 HTMLOUT=0

C- BUFCOMMAND TAG=255 RAW=0

2) COMMAND STACK:

CMDSTACK1 [64] [32] [16] [08] [04] [02] [01]

CMDSTACK2 [64] [32] [16] [08] [04] [02] [01]

4. COMMAND

1.. This works in conjunction with the KERNEL module in that it will verify that what is in the BUFFER is html code. It examines the buffer's start for an html tag, compares it against its command table and if it doesn't find a match, sets the COMMAND flag to RAW and returns control to KERNEL.
If it matches the html tag with a command, it sends it to HTMLIN for processing, along with setting the CMDSTACK byte to its necessary flags for HTMLIN.

2.. Can be modified by enduser or developer to incorporate additional support, such as music support, or to add additional modules such as ftp/email. Table for COMMAND is loaded during INIT from either the cartridge or a diskfile. If PHOENIX is the cartridge version, the user must have set the flag in his SETTINGS panel to have PHOENIX recognize that the COMMAND table needs to be patched with add-on commands. The appropriate format for patching is as follows (text-only!):
Format for a new COMMAND to be added into table:

128,command-name,command-module-name,0,255

The "128" tells INIT that this is an incoming COMMAND patch.

The "0" designates the end of the patch.

The "255" signifies end of patching sequence, EOF. If there are more COMMANDS to be patched, then there would be another "128," after the "0," until done, and then the "255."

3.. There is no check to assure that the original COMMANDS are not overwritten! However, the flag for MODIFIED is set to high when the COMMAND table is patched, so if PHOENIX starts behaving erratically, check the MODIFIED bit to see if the COMMAND table was modified. If it was, and you want to determine if the patch is at fault, simply set the flag in your SETUP to disallow patching of the COMMAND table and restart PHOENIX.
If the problem stops, then you've discovered the culprit!

4.. Again, this is a wonderful provision of expandability provided to the enduser. By adding a command for KERNEL to access, you can add power to your web browser! Your add-in patch can direct HTMLIN to act in certain ways in response to the code it may have otherwise discarded or shown as raw text, as an example. You could re-direct it to a file on your floppy drive (if you have enough room!) or to a hard disk, even. The possibilities are there, if you have the imagination and motivation to do it. I've made the S.T.I.P. simple enough that you should have little trouble customizing your own copy of PHOENIX or making your add-in patches available on the internet for

others to use. The only draw back is that you must use 6502 ML to write the module. If you don't know ML, there may still be a pseudo-compiler available at one of the Atari archives that takes BASIC and converts it into ML (I used to use one from Analog Magazine years ago!) if you want to write it in BASIC instead.

Again, this is nothing more than my initial notes. Some things will change as the design becomes more firm.

Essentially, PHOENIX will serve as a means for the Atari 8bit user to connect to the WWW, using what I am calling a "in progress" interpreter. Simply put: it will act like BASIC's intepreter does, only you aren't typing in the html it is acting upon (like someone typing in the BASIC program for you).

The S.T.I.P. concept should allow for a centralized KERNEL and companion modules and yet allow for either customization or additional components. The trick will be how to add in new commands in a cartridge setting.

Having established REGISTERS for PHOENIX and aspiring programmers should ease things, too, since various values and settings will be accessible via a table of bytes (with flagged bits as the means of discernment, rather than wasting entire bytes for a particular value).

Conserving memory is vital in the Atari. PHOENIX is being built specifically to utilize not only VBLANK processing, but memory bank switching, too! Add to that that my current scenario is to have the browser burned into a 256K rom cartridge (banked memory), and looking into how 128K of RAM can accompany that for high-speed writes for caching. and this should be a decent little web browser for the Atari 8bit!

The credit list will be intact as well, for all those who have been such a tremendous help with this thus far!

try this:

```
10 GRAPHICS 9
20 GOTO 20
```

If you get a black screen, you have the GTIA. If you get a blue screen, you
have the CTIA.

Aaron:
> Why was such stringent timing necessary?

Cameron:
> ou can trigger an interrupt on a specific scan line, but this isn't
> useful where you have to trigger the IRQ scanline after scanline.

With housekeeping routines at the end of an IRQ it takes more than one
line anyway.

> Much more useful to simply wait out (in Martijn's case) 63 cycles, and
> then you *know* you're on the next scan line.

And once every eight rasterlines you have to wait 40 cycles for the
badline.

On 3 Feb 1999, Jason Compton wrote:

> One does not go to the ROM tree, one goes to a computer reseller, which is
> where people go to buy SpartaDOS, right?
>
SpartaDOS was available direct from ICD, which maintained a BBS with free
updates and new COMs. Later it was released as shareware when FTe bought
the rights and a Y2K compatible version was widely distributed via
Internet and at least 100 BBS in N. America and Europe.

> Were many Atari DOSes sold and updated through online services and then
> downloaded over a modem?
>
See above re. Sparta. The other widely-used DOS is MYDOS which was
released to PD by the authors who continue to support it. It is freely
available on disk through user groups, in the UMich archive, and on
numerous BBS.

> An interesting contention. I can name at least 4 third-party Commodore
> DOS ROM replacements. How many third-party Atari DOSes were there?
>
LJK DOS
OSS DOSXL
OSS OSA+
SuperDOS
SpartaDOS
MYDOS
TopDOS
SmartDOS
Q-DOS
MachDOS
TurboDOS
BiboDOS
BW-DOS
Those are the ones I can think of off-hand. The best common feature of
them all is that if they didn't use Atari DOS 2 format, they at least came
with a utility to access it.

In that case....does anyone have any hints for taking the keyboard off the motherboard? From what I can gather, it's a bit of a pig to get off. Is it also true that the keyboard cable is very fragile?

Thanks,

Trystan

Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm

It occurred to me that Aaron wrote in comp.sys.cbm:

> I understand the C-64's additional overhead (in relation to the Atari)
> in producing a RASTER INTERRUPT on every line. But blind scanline
> timing seems to be a bit too primitive (and inaccurate). If the C-64
> doesn't have a hardware method comperable to the Atari's WSYNC then
> perhaps a C-64 program could simulate it by constantly reading the
> raster register for the raster line change and then immediately update
> the color registers. Unfortunately, setting up this testing loop may
> consume too many clock cycles to be of importance. =-(

The VIC-II doesn't have such a WSYNC-thingy (Could be quite handy, indeed).
Building a loop like

```
ldx #desired_value
loop cpx $D012 ; $D012 contains the lower 8 bits of the raster
; counter
bne loop
```

can narrow things down a bit, but you still have a margin of a couple
of cycles. Since you _know_ how long a screen line lasts (63 cycles
on a PAL machine, 65 cycles on a NTSC machine)(no bad lines assumed),
you can time it -exactly-.

Welcome to the comp.sys.atari.8bit newsgroup!

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current
mailto:mcurrent@carleton.edu

Please refer to the latest version of this FAQ list whenever possible!

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of my more prominent sources:
- Atari Classics, published by Bob Woolley
- New Atari User, published by Page 6 Publishing (Les and Sandy Ellingham)

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

1676. Re: I need help running emulators

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-03 00:00:00 UTC
From: mstulir@geocities.com
Message-ID: <799qm7hdp1@nnrp1.dejanews.com>
Source record: 55142

(mrkenn25@aol.com wrote some questions about using Atari 8-bit emulators:

Well, for starters, you are probably better off using the Atari800Win emulator. I have had problems myself with XL-It, and I'm not sure if it has been updated recently.

If you take the time to visit my website (link below), you will find a whole page dedicated to this outstanding emulator, and a link to download it. Just look in the Atari 8-bit Computer topic, and you will see the page for Atari800Win.

That, and the fact that the relationships are very reliable. The only bugaboo
is that PAL and NTSC systems have different timings (actually, there's two
NTSC timings; old NTSC 64s had 64 cycles/scanline). Set the interrupt flag
and wait. The raster will always come around at the prescribed time. It's not
inaccurate at all.

There's also a slight problem with the routine you've proposed. While the
current scanline register at $d012 will tell you what scanline VIC-II is
drawing, it will not tell you how far along the scanline the raster is
already. If you've wasted a non-integral multiple of {63, 64, 65} cycles
waiting for the raster to change, you're going to execute your register
change in the middle of the screen. Useful in some routines for horizontal
splits, but not very handy if you want to do things scanline by scanline.

I would assume that's 42 cycles in NTSC-land.

AFIK: LJK, OSA+, Q-DOS, and Sparta are 100% original with their own disk
allocation schemes.

MYDOS is DOS 2.0 compatible but goes far beyond it in features and
capabilities--it is definitely not a "hack".

BW-DOS is a Sparta work-alike.

With the exception of BiboDOS and TurboDOS, I know the rest are DOS 2 or
DOS 2.5 clones. As to Bibo and Turbo: you'd have to ask someone with a
European address.

I believe you can get them both ways, at least at one time American TV
was offering discounts for full chip sets.

Another posibility to get a 5200 game system. The LSI chip sets are identical with the exception of a missing 6520<?> PIA on the 5200. Everytime I see a 5200 in a thrift shop or surplus electronics shop I usually buy them for parts. 90% of the time 5200 system was junked because of problems with the power supply or joysticks, I used to know someone in Atari Customer Service<grin>, so the electronics are fine.

Matter of fact, I have 1 or 2 5200 motherboards right now. If you still have problems with your system and or getting an order in to Best, let me know.

Yes,

The BBC Micro B+ was briefly sold in the US in 1983/84.

A report in Your Computer at the time said the machine was
not well received, being labelled as over-priced. I expect
it would have struggled against the very well established
Apple II, and was just too expensive compared to the
Commodore 64 or Atari.

Personally I never liked the Acorn keyboards, I felt they
never had enough 'give' in them. After only a few minutes
if typing I found the tips of my finger went numb. Mind
you, they were alot better than the brand-new Compaq
Windows 95-enhanced keyboard I just got a work this week.

My favourties were the 1200XL and the original IBM 101-key
'clicky' keyboard, both of which I still use at home.

Graham

>In that case....does anyone have any hints for taking the keyboard off the
>motherboard? From what I can gather, it's a bit of a pig to get off. Is it
>also true that the keyboard cable is very fragile?

The keyboard cable certainly looks fragile. However, I've never
actually broken one...despite making some very stupid mistakes during
past disassemblies. To minimize repeating my own mistakes, read the
following steps for keyboard disassembly of the Atari 600XL/800XL
computers. Taking out the keyboard from the computer should be
relatively pain free.

The keyboard should be quite easy to take off. Here's the general
procedure:

1) Flip the computer over and remove the (4-6?)) screws.
2) (CAREFUL!) While holding the computer together, flip the computer
around so that the keyboard is on top.

(VERY CAREFUL!!! Before proceeding to the next step be aware that the
connector between the keyboard and the motherboard is very short and
flimsy. READ CAREFULLY before attempting the following step.)

3) The top and bottom half of the computer must be opened like a book.
Position the computer as if you were going to type on it. While
keeping the right part of the upper case stationary, gently lift the
left part of the upper case (containing the keyboard) all the way up
and over so that the the top of the keyboard is now laying on the
floor just to the right of the lower part of the case.

4) The two halves of the computer should now be exposed. The left part
contains the guts of the computer (motherboard, metal shielding, CPU,
etc) and the right part is the keyboard (with the back end facing
upward). You should now see a flat plastic ribbon cable running
between the keyboard and the motherboard. With both hands, gently pull
the keyboard cable from the motherboard STRAIGHT UPWARD.

Both halves of the computer should now be separated.

5) The final (and simple) step is to unscrew the keyboard from the
upper part of the case.

Hope this helps. =-)

Yes. Due to the incometence of Atari (or Jack Tramiel?), the official
version of Rescue on Fractalus got buried for a couple of years before
it was finally (and belatedly) released.

1697. Re: Atari 8-bit Web Browser questions

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-03 00:00:00 UTC
From: Don Rae <donrae@telusplanet.net>
Message-ID: <_h3u2.1572$_Y2.8227@news2.telusplanet.net>
Source record: 55163

I think I'm going to a crack at this problem, to see if it can be done.
These are my projections:

1) "Web/HTML" access is not easily possible (at this point, I would say
impossible), due to the natural constraints of the 8-bit's graphical
capabilities, and available memory. I think this will just too much to ask
from this particular machine.

2) Building a TCP/IP socket shouldn't be too difficult. Building an
efficient one might be very difficult. I'm still not sure yet if I will
need the 130XE to do this or not....the extra 64K would sure be handy in
this regard, leaving more space open for programs (eg. FTP). PPP will need
to be layered into the model as appropriate.

3) Assuming a protocol stack can be achieved, FTP shouldn't be much of a
problem either. At the very least, this kind of thing should be
possible....the only real problem is in "time out" related issues while the
Atari disk I/O is taking place. At an extreme, I suspect that the APE
interface might be required to handle this level of I/O demand.

4) I'm not even going to attempt a mail API. This will be up to someone
else to try out, assuming that I can get any of the other stuff working.
(Can you just picture yourself saving mail files at 10 per 88K disk!?) Nor
am I going to try IRC....that's a lot of work for the minimal returns you
get - someone else might be interested in trying this one....(it probably
could be written in BASIC, assuming that there are enough hooks in place
from the protocol stack).

5) Another possible approach is a driver/application gateway to the
Microsoft Windows API, and use Windows' native TCP/IP and PPP support. This
could be done a variety of ways via RS-232 communications, essentially
creating a "null modem" approach to the whole issue, with some contained
application interfaces to handle the I/O traffic.

If I make any progress on this, I'll be letting everyone know.

- Don

Thank you, I bookmarked the site. I already have the 800 downloaded, I just do not know how to use it. I am trying to play the AR games and the return of hercules.

I will look at your site when I return from class.

Thanks again

Kenn

1700. Re: Atari 8-bit Web Browser questions

First off, I would recommend that you look for my post hereabouts regarding
"Project: PHOENIX Notes" so that you'll have a better idea about what I'm
about to start ranting about. It's a 12K post, but it's sheer text. Or drop
me an email and I shall email it to you. Much of this is discussed in there.

Now, regarding your position that web/html access on the Atari 8bit is not
easily possible (to which you add that you say it is impossible): If you are
referring to the fact that the Atari cannot easily and/or feasibly display
the grafix that one finds in a 640x480-friendly browser (or higher), then
you are correct. The Atari 8bit cannot display pictures in a way that makes
them recognizable since most are GIFs and JPGs. However, don't let
shortsightedness so easily overwhelm you. Many HTML pages offer ALT TEXT for
non-graphical browsers. Why not utilize them? And in the case where ALT TEXT
tags are not available, why not have the HTML interpreter look for other
indicators, or display what the picture would have been...? See, PHOENIX is
ideal from my standpoint since I am looking to one of the most basic
programs to handle the www... BASIC. BASIC, when you type in a command in
immediate mode, responds by carrying it out, right? PHOENIX' HTML
interpreter is designed the same way. It gets an html tag, checks if its a
valid instruction for the program, and then carry out the instruction. If
not, it has the choice of returning it to the user as RAW text/data or
dismissing it entirely. How fast can you type? Is your Atari having a hard
time keeping up to your typing skills or does it spend most of its time
waiting for you to hit the next key? Now, pretend that you could just stream
those instructions to BASIC and you're on your way to understanding how
PHOENIX will operate its HTML interpreter. Got grafix in a given page? Fine,
show the user that there is a IMAGE = icon.gif on the display and we're
almost there. I say almost because some pages use grafix as navigational
tools. But that is for another conversational moment.

Needless to say, it is NOT impossible. It depends on how openminded you are
to solutions...

>2) Building a TCP/IP socket shouldn't be too difficult. Building an

>need the 130XE to do this or not....the extra 64K would sure be handy in
>this regard, leaving more space open for programs (eg. FTP). PPP will need
>to be layered into the model as appropriate.
>
It's already done. Here are the places you can check for additional info.
The C64 crowd has it. Now, we just need someone to port it to the Atari:
http://131.188.190.131/~poldi/verw.html
ftp://131.188.190.131:/pub/c64/
There's other places, too, if you have some surfing time available... all
for the 6502 processor!

>3) Assuming a protocol stack can be achieved, FTP shouldn't be much of a
>problem either. At the very least, this kind of thing should be
>possible....the only real problem is in "time out" related issues while the
>Atari disk I/O is taking place. At an extreme, I suspect that the APE
>interface might be required to handle this level of I/O demand.
>
Correct. FTP is achievable on the Atari... Now, you brought up an
interesting point regarding the Atari's dubious need to lock out all other
activities during SIO. Why hasn't anyone designed a little plastic
doo-hickey that connects to both PIA ports (joystick) and made use of those?
Like a little 2x4x1 box that contains the coolest interface ever seen for
modems, HDs, etc? The Atari can be controlled and accessed via the joystick
ports according to documentation...

>4) I'm not even going to attempt a mail API. This will be up to someone
>else to try out, assuming that I can get any of the other stuff working.
>(Can you just picture yourself saving mail files at 10 per 88K disk!?) Nor

>get - someone else might be interested in trying this one....(it probably
>could be written in BASIC, assuming that there are enough hooks in place
>from the protocol stack).
>
I agree with you on that, and have said the same regarding MAIL. IRC might
be fun, though.

>5) Another possible approach is a driver/application gateway to the
>Microsoft Windows API, and use Windows' native TCP/IP and PPP support.
This
>could be done a variety of ways via RS-232 communications, essentially
>creating a "null modem" approach to the whole issue, with some contained
>application interfaces to handle the I/O traffic.
>
Ah, but not every Atari owner wants to bother with the PC when the Atari can
do the work. What then? Remember, the goal here is to provide the Atari user
with a web browser so he doesn't NEED a PC...

>If I make any progress on this, I'll be letting everyone know.

Nope. SpartaDOS for the Atari8 beats it. Someone said something
about OS9 for the CoCo being really kick ass too and that sounds like
it might get the prize for most powerful 8-bit DOS.

Had to go down to the library to check my reference. According to Ron Pronk, in The Power Mac book!, (Coriolis Group Books, Scottsdale, AZ) published in 1995: Apple wanted IBM's cpu but Motorola's bus. So, while future PPC's were joint IBM-Motorola developments, the 6100 was 100% IBM-produced, sold to Motorola, and appeared in the Power Macs bearing the Motorola logo.

Hi Marc,

>Also, the Atari "sprites" were smaller, harder to use, and had less
>colour options available -

Actually....Atari sprites are not smaller than CBM ones, just different.

True you can only assign one colour to each sprite, but since you have display list interrupts you can get some very nice effects with them. Also a player or a missile extends over the entire height of the screen so you don't need to multiplex them vertically. Plus the code you need to write to move a sprite up or down is trivial.

Like I said, just different.

>Even though the Atari was less popular in the UK than the 64, it did
>have an excellent magazine from Page 6 called "Atari User"....

Actually they published a magazine called "Page 6" for about 10 years before coming out with "Atari User", I've still got a few copies hanging around somewhere....

>The machine's parent company supported it better than Commodore did
>for the 64 (face it, every other computer was better supported!).

Except Atari had no idea about marketing....witness the ST, Lynx, 7800 and Jaguar. :-(

>And the disk drive was a dog.

May have been a dog, but vastly outperformed any of CBMs offerings. And I don't recally an Archiver, a US Doubler, or a Happy upgrade for the 1541.

The 1051 really wasn't a very good drive I'll agree, a major case of too little too late, and the unavailability of spares (at least here in the UK) sealed it's fate. The original 810 was an excellent drive, I still have a couple which are still going strong.

Not that Ataris' peripherals were ever anything other than adequate - and pricey - though I could say the same thing about CBM's.

I used and programmed both systems for years, both had their advantages and disadvantages. My personal preference is towards the Atari as an overall system - which doesn't mean I dislike the C64, I just don't like using it as much.

From your response, it seems to me that you do indeed care.

>over the C64. You live up to the fears of those who think this thread
>will turn into a religious thing like the old days by refusing to
>acknowledge the obvious.

And yet, you seem to refuse to acknowledge either the obvious
disadvantages of a software-based DOS or the obvious advantages
of a device-ROM based system.

It never seems to occur to people that the C= does indeed support
software-based DOSes, and many have been written. Many games use
a custom DOS, and GEOS is a prime example of a system with its own DOS.
It also highlights the failings of a custom DOS -- software incompatability,
so that it is nontrivial to e.g. copy a GEOS file onto a normal disk,
and hardware incompatability, so that GEOS must be physically patched
to use modern hardware.

Can you instantly use new devices with your old programs, or do you
have to wait until someone writes a new DOS? Can you access files
in a SpartaDOS subdirectory without owning SpartaDOS? And what
happens to the vaunted autoboot capability, when you have to load
an entirely different program, just to run a program (e.g. with a
new device)?

On my 64, I plugged in my FD-2000 and instantly my 1984 assembler
could create subdirectories, change partitions, and instantly
inherited all the features the new device had to offer -- without
rewriting one line of code, and without losing compatability with
any other program.

Software DOSes never caught on simply because the C= DOS works fine.
Most of us have access to all kinds of different operating systems and
such, and yet don't have much problem with using their C=; in fact, some
of us rather like the system. C= programmers are interested in
getting something done; if the system works well and does the job,
then I doubt anyone cares whether it meets somebody's theoretical
model of advantageous operation.

A question for the hardware wizards:

Is there any way, at reasonable cost, the 2k of RAM at $D000-$D7FF could be re-mapped to appear outside the hardware address range--something similar to the way the Self-Test ROM is banked in at $5000?

It kind of bugs me knowing it's there but unusable :)

'ello,

i dont know where you come from but where i am from cutting an ic like this would seal its fate and let out the 'magic smoke' i do remember reading in a mag (pop electronics or something) about a memory chip designed like how you are attempting.... it had a reader prg and hookup info for an apple // i dont think i have the mag anymore but if you prod i could look for it..... but if you wanted to cutting a ram anywho you would use a sram (62128 i think) the 62xxx series srams are almost drop in replacements for 27xxx eproms.... (byte (back when its name had something to do with its content) eprom emulator that was basically a 6264 (8kbyte X 8bit ram) hooked to a cap in a small package... if you do actually find a way to cut them open i would be interested in getting one.....

Yeap, I got more specific when I got my notes out<grin>. Kind of a
rigged explaination in the 2nd round since I had built a 74ls174 latch
into a cartidge port device I had made. I think I still made a mistake &
refered to it mostly $D5xx, but a typo $D1xx may have made it through.

Just now trying to get back into it after a long layoff. Damn soldering
iron actually rusted/coroded it has been so long.

As usual, I seem to be thinking in terms of projects that come under the
catagory of "Why would he do that and even if he did it, why would he do
it that way?"

I never liked the way OSS carts worked. That banking 4k lumps. Just have
every 8k block start with some code to switch the cart back to the first
bank, that is at ROM location 0, you have
LDA #0
STA $D500
and at ROM Location $2000 you have the same. That way no matter which
bank comes up, it resets itself to the first one & continues from there.
I guess you would have to have the cart init & run vectors mirrored too,
but much simpler scheme IMO.

Reworking a 1200xl now for the project, I hope it survives me.

They're a third of the width and taller, but generally speaking people tend to prefer using square objects. I mean, how many alien spaceships have you seen that are sixteen times as tall as they are wide? =-)

> True you can only assign one colour to each sprite, but since you have
> display list interrupts you can get some very nice effects with them.

But not three different colours on a scanline like C64 sprites in multicolour mode.

> Also a player or a missile extends over the entire height of the
> screen so you don't need to multiplex them vertically. Plus the code
> you need to write to move a sprite up or down is trivial.

But not as trivial as, say, DEC $D001 to move sprite 1 up or INC $D001 to move it down, is it? You have to shift (for an 8x8 object) sixteen bytes per object per frame. For something the size of one C64 sprite that means you're moving 126 bytes of data *just* for vertical positioning.

1719. Mac&PC games for trade for Atari games

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-04 00:00:00 UTC
From: "Daniel F. Boese" <dan_boese@und.nodak.edu>
Message-ID: <36B94ED4.B50D8D49@und.nodak.edu>
Source record: 54994

Hi all,

I have the following used mac and pc games(no boxes, most with
instructions) I would like to trade for used jag cartridges and/or 8-bit
atari computer cartridges:

Unreal ---------------------------------- Mac
Warcraft Warchest -------------------- Mac/PC
Jazz Jackrabbit 2 ---------------------- PC
Mastermind ----------------------------PC
Boggle ---------------------------------PC
Ultra Pinball Collector's Edition ---- Mac/PC
Experience C++ (IBM MMTutorial)-PC
MYST(new-shrinkwrapped)--------- Jaguar
Defender, Quix, and Pacman -------- 8-bit Atari computer

The jag games I'm looking for are:
ATARI KARTS
BRUTAL SPORTS FOOTBALL
BUBSY BOBCAT
CLUB DRIVE
DEFENDER 2000
DINO DUDES
DOUBLE DRAGON 5
DRAGON BRUCE LEE
FEVER PITCH SOCCER
FIGHT FOR LIFE
I-WAR
KASUMI NINJA
MISSLE COMMAND 3-D
NBA JAM TOURNAMENT EDITION
POWERDRIVE RALLY
SENSIBLE SOCCER
SUPER BURNOUT
SUPERCROSS 3-D
SYNDICATE
VAL D'ISERE SKIING
WHITE MEN CAN'T JUMP
WORMS
ZOOP
BRAINDEAD 13
DRAGON'S LAIR
SPACE ACE

WORLD TOUR RACING

I'm also looking for almost any 8-bit computer cartridge game except for Defender, Quix, Pacman, Missile Command, Bughunt, and Flight Simulator II.

sincerely,

Dan Boese

>'D8' with 16mbyte per drive designator.....)

That may have been the case with that Lt. Kernal, though not with the units I've encountered, but modern CMD HDs definitely don't work that way. You can either use them to emulate 1541 disk drives, or use them natively. In any case, there's no such business as a 'high floppy' and 'low floppy' number these days -- just LOAD"X",device and go. The device number doesn't vary per partition.

Also, wedges are rarely used these days. Many people have JiffyDOS installed, still others use Epyx FastLoad, and there's a smattering of cartridge speeders and DOS command extenders in addition (Final Cartridge, Super Snapshot, Mach, Action Replay, etc.). It would be very annoying to load that from disk all the time and set it up.

This is an illusion created by your brain. Monocular vision is two
dimensional.

It's similar in a fashion to the way your brain has created the illusion that
this thread has any value to anyone.

Jeff

Actually, The 601 was the FIRST PowerPC chip and it was made by IBM and
then licensed to Apple. Motorola makes the motherboards and bus. The
603 was after that.

Also, if you notice, if there is any mention to the PowerPC chip in the
documentation, it will say that it is copyrighted to IBM. In 1995,
Apple allowed clone Macs to be produced (and then in 1998 stopped that)
and the Motorola StarMax was one of the first to be made w/ the
agreement that anything developed in that computer had to be shared w/
Apple (technology wise).

For example, the G3 chip was original manufactured and developed by
Motorola for thier StarMax machines, but w/ an agreement w/ Apple, the
chip is now used in the new PowerMacs (especially since the StarMax's
are no longer made).

Of course, the biggest clone maker at the time of PowerPC Macs was Power
Computing but Apple just decided to buy them and the technology they had
that made them able to make better computers at a lower price, hence
killing Apple for awhile. They are also they main reason the clones
have almost become obliverated (except for UMAX which I guess Apple
didn't consider them a threat because they were so crappy, but even they
are starting to die out as a clone maker).

SmartDOS was my all time favorite. Most likely because I didn't know
how to use MY-DOS or SpartaDOS. But at least those three I mentioned
have VERY original code.

SmartDOS is actually fun to use (especially when formating, copying, or
deleting files).

Actually, because of the way the bits are used in a C-64 sprite (in
color mode, 2 bits for every sprite pixel), the difference in width is
more like 50% wider than an Atari "sprite". (C64's 12 pixels across
vs. Atari's 8 pixels across).

>> True you can only assign one colour to each sprite, but since you have

I'm in agreement. The C-64 sprite system was more "polished" than the
Atari's sprite method.

DITTO. It's interesting that the C-64's advanced hardware sprite
movement ability was about on par with the Atari's background bitmap
hardware movement abilities. It's too bad that neither computer had
BOTH strengths.

Come on. Don't you remember reading the lackluster reviews when the
Atari 1200XL was first introduced? Needless to say, the 1200XL was
unsuccessful in the marketplace. Still, I have one of these
wonderfully looking babies and I would absolutely *NOT* part with it.
The XL line in general is so snazzy looking. Why is it that most 8-bit

computers (including the C-64 series) look so ugly?

Funny mention about the Amiga. In the halcyon days of 8-bit-dom, the wonders of my Atari 800XL was the major factor in my decision to select the Amiga as my 16-bit computer of choice.

Use APE (Atari Peripheral Emulator) to have your 800 hooked to both your PC (where the ATR image is) and your Indus drive. The 800 will look at the ATR file as if it were a floppy, and you can copy it to a floppy in your Atari drive.

Besides, Tom Hunt is working on this. I've seen some preliminary stuff from
him on it, and it looks like he's on the right track. But I've heard
nothing from him recently.

Wouldn't it make more sense to recognize the file type from the web
server (text/text)?

Onlong the same lines, I recently got a Palm III, and started to look at
it's specs compared to my beloved XL, and a couple of things caught my
eye..

Display is 160X160 in four shades of grey, sounds pretty familar....

It only has 2MB RAM, but the first Palms only had 512K, and they have to
use this for applications and data.

I download ProxiWeb, connected to the net, and was surfing in full
graphics glory...

I think Project: Phoenix should investigate using a proxy server, much
like ProxiWeb. It reformats the graphics and simplifies the HTML to look
better (much like WebTV also). All this in approximately 125K (in 68000
code, and I know 6502 can be more compact).

Fine,
>show the user that there is a IMAGE = icon.gif on the display and we're
>almost there. I say almost because some pages use grafix as navigational
>tools. But that is for another conversational moment.

Ok, granted...you do have a point here. I was generally speaking from the
"graphical" context only - graphical content is plainly impossible.
Unfortunately, this fact always leads to a greatly diminished web
experience, which makes one wonder if an HTML interpreter/converter effort
is truly worthwhile - as time goes by, more and more graphical content is
the norm on the internet, and the time and effort put into an HTML project
might be questionable in this context. The only "purist" answer to internet
graphics is to try and convert them on the fly (bleah), when you click on
the "image" box (as you propose). But now we're starting to venture into
realms of extremism. Sure this might be possible if you custom wired your
Atari 8-bit to read 1 meg of memory, but the complexity of this kind of
arrangement makes it feasibly impractical for the average hobbyist.

Considering this, I wonder if it might instead be better to build a specialized browser-type utility to read ATASCII/graphical content instead, and build a specialized interface for it. Atari systems can easily exist within the internet framework this way. If you wanted, it should be possible to include Atari capable interactive graphical content on such a design - player/missles/sprites, etc. Lord knows there are plenty of templates to start this kind of work from - remember all the "ATASCII Animator" type tools? Funnelling streams of information in this manner would be relatively simple to implement. You make one application that builds content (eg. Atari "Frontpage"), and another to read it (Atari "Internet Explorer").

This is a neat idea....I think it's worth pursuing. Of course, there's always the memory limitation problem that needs to be dealt with, but the advantage here is - we're not building a BBS system here! This approach vs. the old BBS approach - is much easier to manage - if not solely because you are continously changing your active memory content from an internet source that exists outside of normal Atari I/O streams! You can always set up a system framework where you "download" crucial applications (in a reserved block of memory for them) for "specific purposes"....such as "FTP", for example.

Hell, you could even build interactive 6502/8-bit net games this way. And in case you really wanted to leap the fence, one could suppose that the same theory would apply to the C64 as well. (Build an equivalent for the C64, making them interoperable at the internet level....I shudder at the thought of it - so I guess I still have my old prejudices, it seems).

Another line of thought, for a second....

Another really far out idea on this line of thought is to make your Atari BOOT AN OS FROM THE INTERNET. This should be very possible using an APE equivalent application/cable interface!! If you can build a hardware item that is specific to this task, who knows, it might be a moneymaker....

So, would anyone care to build a new internet version of MULE?

>Needless to say, it is NOT impossible. It depends on how openminded you are

>doo-hickey that connects to both PIA ports (joystick) and made use of
those?
>Like a little 2x4x1 box that contains the coolest interface ever seen for
>modems, HDs, etc? The Atari can be controlled and accessed via the joystick
>ports according to documentation...

It's tough to do I/O in two directions at once with the Atari, but you're right - the joystick access can do this simultaneously. The old MPP-1000C modems used to work this way (plugged into a joystick port)....but I think there are significant baud rate limitations (I'd have to dig a bit to find this info). I doubt if you could achieve much beyond 400 baud using this approach, and I'm not sure how much the ol' 6502 can handle when faced with multiple dedicated I/O streams. If I remember correctly, it would be difficult.

I'll be watching your progress on your PHOENIX project with interest.

- Don

Ar> My goal is to make 'collection disks' for myself that are single or
Ar> double density, but a Mega .ATR is like 1.02 Megabytes.
Ar> How can I do this?

Well,
you could use XDIR v5.05 to extract the files (and/or subdirectories)
from the Atari disk image,
and then use DIR2ATR v10.05 to stuff those files (and/or subdirectories)
into the desired disk image and size.
Both PC based programs can be download from my website.

That's starting to sound like my only option.

I was looking for a way to keep the Atari machine in a different room. I suppose that I could move it temporarily, build the cable, copy from SIO drive to Indus drive, and move it back.

I had just been hoping for a software-only solution. It seems like an awful lot of trouble to go to for a single disk, and the lack of a program to do so seems a strange omission.

Thanks, Trevor!

Funny that you should mention science. The revolutionary contribution
of science to the world was a simple idea: instead of sitting in a dark
room, deducing the mysteries of the universe by reason alone, we can
test the validity of an idea, by performing an experiment to see if
it is actually correct.

For example, to test the assertion that the world's 3D appearance
depends on our having two eyes, a motivated individual can cover
one of his eyes and see what happens. I do not think it is a
particularly difficult experiment, but as you do not seem to have
successfully performed it, I can assure you that the world does
not lose its three-dimensional appearance.

I am sorry that you feel the need to engage in rather weak
ad hominem style arguments; unless you have something of substance
to say, then I reckon there is little purpose in continuing the
discussion.

-Steve

Yes, me too. An official "Radio Shack TRS-80 Pocket Computer Model PC-2." Of course, you'd have to have some pretty huge pockets (8" x 2" x 1").

Those things were really ahead of their time. Although the plotter/cassette interface went south a long time ago, it still works great. BASIC interpreter (more complete than C64), dot-addressable 40-col. display, variable-pitch sound, keyboard macros, and 20K of nonvolatile RAM (with a 16K Sharp add-in module). Nerdvana.

I did not want to join this thread. Steve is, of course right, as
binocular disparity isn't the only way for us to perceive, there
are
other - what we call - depth cues: Overlap, size/height in the
field
of view, texture gradient, motion parallax, atmospheric
perspective to
name just a few.

By displaying a 3d scene on a 2d screen you are loosing some of
these
depth cues, mainly the binocular disparity. Still depth can be
perceived
in the picture using the other cues.

So IMHO Quake and Co. are as 3d as it gets.

bye, Paul.

For an almost related question:

I have an 800xl the boots fine to BASIC prompt, but does not detect
any game cartridges.

I have cleaned all connector contacts and did continuity checks on all
connector and board traces. These appear to match another 800xl I am
using.

Could there be a failing support chip that would not have an effect on
the BASIC boot?

Thanks - John

This sounds like a bad PAL chip - CO60618. He is the guy who "sees" the
cart. and sends the selects to it... all that S4, S5, RD4, and RD5 stuff.

Please direct all replies through E-Mail to bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I do not regularly read NewsGroups.

I have some stuff to unload. I have a lot of Atari Magazines. For the person who takes the whole lot. Some including disks. I don't want to have to go through them or sort them out. I just want someone to take them off my hands for the cost of Shipping. Classic Atari 8 Bit & Atari ST. I also have some Atari Hardware that doesn't work that someone can have for spare parts or tinker with to try to repair.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my Desk-Top Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can load them into your text editor or Word Processor and view them, edit them or print them out! It would make things easier if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend. Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Hi Atarian(s),

Iï¿½ve just finished my update of the new DIR2ATR and XDIR
programs, and have updated my homepage accordingly.

DIR2ATR
========
Version 5.05.00 lets you turn a pc directory
(or more pc directories in the case of Spartados)
into one or more .ATR or .XFD disk images.
It supports Single, Medium, Enhanced, Double, Quad, 720KB,
1.44 MB and 16 MB disk images.
The following OS-es are supported: Dos 2.5, MyDos 4.53,
BeWeDos 1.30 and SpartaDos 3.3a.
Although the program is designed to accept SpartaDos/X as well,
the bootcode for it is not included in the archive.
The program accepts your own favourite DOS too, just use
the "MY OWN DOS" feature of the program.
Please note that the directories you are converting should
contain Atari XL/XE files and/or text files. Just a reminder.
The update solves a bug with the configuration file,
a command line interface has been added, and the program
has a fast drive switching option now.

XDIR
====
Version 10.05 now supports a command line interface as well,
has the fast drive switching option.
A bug concerning a multiple extraction of the same disk image
(which stopped the program), has been solved as well.

So download these new versions, and let me know what you think.
Regards,
Bo Schreurs

Anyone here have a boxed/complete MISSILE COMMAND for the 8-bit Atari that
they want to sell? [if not BOXED it's ok - as long as it has the instructions]

If so, send me an e-mail and we can discuss it further. :^)

-Paul

hmmm, being an amiga user in addition to a mac user (and an atari user ;') i
always thought jason knew all but it seems my image of him if getting shaky
;') but the way it went was apple motorola and ibm got together to design a
new chip, all parties thought the power pc chip ibm had been using in their
rs/6000 machine would be a good base so used it..... and the chips in
6/7/8100 macs all have ibm logo's on them (i have a 6100 here at home and
use a 8100 at work) the 603 was the first from the joint venture...

>
>One does not go to the ROM tree, one goes to a computer reseller, which is
>where people go to buy SpartaDOS, right?

It's where some of them go. Other ones just download illegal copies
of it or work-a-likes like BeWe DOS. I personally bought SpartaDOS
1.x, 2.x, 3.x and SpartaDOS X (4.x) from ICD.

>Were many Atari DOSes sold and updated through online services and then
>downloaded over a modem?

Well, the offical DOSes that Atari made were made available for
download. Not that you would neccessarily WANT them but they were
available.

>: Plus, software based DOSes are more likely to be updated more
>: frequently due to the ease of distribution, and along with that there
>: are more likely to be more of them to choose from available.
>
>An interesting contention. I can name at least 4 third-party Commodore
>DOS ROM replacements. How many third-party Atari DOSes were there?

How big is your input buffer? Hehe. Let's see....

Atari DOS 2.0s
Atari DOS 2.0d
Atari DOS 2.5
Atari DOS 3
Atari DOS XE
TopDOS

SpartaDOS 1.x Yes all these Sparta's count because they are
SpartaDOS 2.x significant modifications and functionality.
SpartaDOS 3.x
SpartaDOS 4.x
DOS-XL
SuperDOS
OS/A+
BeWE DOS
MyDOS

Besides that, there are lot of minor revisions within many of those listed. When you have a software based DOS, you can afford to make the small changes because it's no big deal. Anyway, all those listed above are major versions.

Those are just ones off the top of my head.

>>help for you. I really don't care about this whole vs. thing, I just
>
>From your response, it seems to me that you do indeed care.

No, I don't. I really could care less about which is the best
computer to own either Atari8 or C64. I honestly think they're both
kindred spirits in the computing world. What I do care about is the
concept of software based OS or DOS as compared to one that is more or
less restricted by ROM or ROM upgrades. I am a strong advocate of the
software route because I think it is the clear winner. I think this
way in a general sense and it is not limited to any one or two
computer types. It's just an over-all opinion, and I defend it with
zeal.

>>over the C64. You live up to the fears of those who think this thread
>>will turn into a religious thing like the old days by refusing to
>>acknowledge the obvious.
>
>And yet, you seem to refuse to acknowledge either the obvious
>disadvantages of a software-based DOS or the obvious advantages
>of a device-ROM based system.

I see no disadvantage. ROM chips can be as expensive as RAM chips.
Weather or not there is adequate RAM for a platform is a DIFFERENT
argument. 64KRAM + XKROM is no better than 64KRAM + XKRAM. RAM can
be bank switched just as easily as ROM can be. In fact, 96KRAM is
more of an advantage than say 64KRAM + 32KROM. RAM solutions offer
more flexability. I stand behind this concept.

>It never seems to occur to people that the C= does indeed support
>software-based DOSes, and many have been written.
>Many games use
>a custom DOS, and GEOS is a prime example of a system with its own DOS.
>It also highlights the failings of a custom DOS -- software incompatability,

Nope. Not a failing. The user has CHOICES about which one to use.
That choice can be either for compatability or not... it's up to the

user. How you can paint a posative as a negative like that I don't know. Anyway, DOSes for the Atari8 are for the vast majority backwardly compatible with the Atari official "standard."

>so that it is nontrivial to e.g. copy a GEOS file onto a normal disk,
>and hardware incompatability, so that GEOS must be physically patched
>to use modern hardware.

No silly it must be SOFTWAREily patched which aint no damn big deal BECAUSE IT IS SOFTWARE.

>Can you instantly use new devices with your old programs, or do you
>have to wait until someone writes a new DOS?

Instantly. The new hardware will come with a software handler which patches into a vector table which is part of central I/O. Because of the OS of the Atari these handlers work with most any of the various DOSes out there.

> Can you access files
>in a SpartaDOS subdirectory without owning SpartaDOS?

Nope, unless it is BeWe DOS. But you CAN access AtariDOS files and disk formats with SpartaDOS. Can a 8086 IBM PC run Pentium optimized assembly code? Nope. Can a Pentium run 8086 code? Yep. I suppose you would try to say that's a disadvantage that there is now software or whatnot that 8086 owners cant use. That damn Pentium optimized assembly code is just plain incompatible with those 8086s out there.... what a terrible circumstance that is.

>And what
>happens to the vaunted autoboot capability, when you have to load
>an entirely different program, just to run a program (e.g. with a
>new device)?

Not applicable as previously explained.

>Software DOSes never caught on simply because the C= DOS works fine.
>Most of us have access to all kinds of different operating systems and
>such, and yet don't have much problem with using their C=; in fact, some
>of us rather like the system. C= programmers are interested in
>getting something done; if the system works well and does the job,
>then I doubt anyone cares whether it meets somebody's theoretical
>model of advantageous operation.

Hehee. Okay there Steve. If simply adequate is just fine by you then suit yourself. I like to have lots of opportunities to expand to something better than just plain ok or decent.

when a c64 user used to tell me how great their c64 was i would ask them what they thought of the speed upgrade when they got a hd... since most of them didnt get one most would give me clueless looks as i told them about my supra hd interface or my mio..... the few that had the lt col. hd i would ask them which 'floppy' was their basic wedge on.... (for the people who dont know the way a c64 accesses a hd is you give it two numbers one a 'high floppy' number and the other a 'low floppy' number to access the hd as one hell of a shitload of floppy disks..... the atari on the other hand would use 'D1:' - 'D8' with 16mbyte per drive designator.....)

(sorry i learned on alot on my plus 4 but i learned everything i needed to know on my atari 1200xl..... the only machine atari made that was worth anything after the 800 (except for the amiga ;'))

1756. write atr or xfd to pc 5.25 drive?

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-04 00:00:00 UTC
From: Russ Brown <russb@io.com>
Message-ID: <79bf2c$8bs$1@hiram.io.com>
Source record: 55186

Is there a PC program that can write an ATR or XFD file to an Atari double density disk using the PC's 5.25" drive? I can find programs for almost every other transformation (and they work fine on my PC drive and Indus GT), but not this one.

Just got my old 800 hooked up again after about 10 years of dormancy. Sure is sweet after a day of DLL hell! But my M.U.L.E. disk, both of its backups, and about half of the rest of my floppies went bad. I have the M.U.L.E. ATR and would like to recreate the destroyed disk, because we all know how pointless life is without M.U.L.E.!

Thanks!

Russ

Hello all!
Well this is my first post to this group.
I have been monitoring it for a while now and I'm glad to have
found people who have as much passion for these old machines as I do.

I guess I could brag a bit..<Dare I?> But I just came across some hardware &
Carts for FREE!!.. There was a little old lady down the street from me who I
Used to deliver papers to many eons ago.. She used to let me come over and play
her daughters Atari 7800 Super System....Well Years have past and we all have "grown up"
She was cleaning out her garrage and called me up..asking if I wanted the system
That I was so fond of years before! IT GETS BETTER!!!
Not only did i get the COMPLETE 7800 system but about 25 games to boot!
And...EVEN BETTER....Her Atari Mega 2 computer!!!!!With color monitor!!! WOW

Don't you just love those little old ladys? Well anyways..these 2 treasures
get added to mycollection.
My first computer was an 800XL and I still use it today...I also have an 800 computer
and a PONG unit......<Found that at a flea market!>
Well anyways....I thought I might brag...<just a little> and look foreward to
posting more messages..finds....facts...and useless bits of information.

HAPPY POSTING ALL>>>

Hi Jason,

>But not three different colours on a scanline like C64 sprites in
>multicolour mode.

True, but you can always overlay the players and there is a mode which allows you to get extra colours when players are overlayed (I'm a bit hazy about this now since it's been about 10 years since I last looked in the technical manual).

>But not as trivial as, say, DEC $D001 to move sprite 1 up or INC $D001
>to move it down, is it?

I don't disagree at all, but I do tend to think that the extra flexibility you get from the sheer height of the player/missile makes up for this.

As I said, I've programmed both systems in the past and I can't honestly say I prefer either one over the other in this respect.

>Is there a PC program that can write an ATR >or XFD file to an Atari double
>density disk using the PC's 5.25" drive?

An interesting question. Unfortunately, I
have never heard of one, but it should be
reasonably easy - much easier than trying
to write A8 files on a PC. At the Dos interrupt
level, you can choose to write 128/256/512
byte sectors (MFM only, unless you have a
very rare early controller). So, you read
the ATR/XFD file with binary input, and then
write out the A8 file sectors (and of course,
the first 3 are 128 byte sectors). Assumes you
have a 360K DD drive. I have heard that
there are problems with some controllers
trying to write 128 byte (MFM) sectors, but I
don't know for a fact. Wish I had time to do
this, but it is a really good idea. I will put it on
my "list" of software projects.
Larry

1766. FS/T Shuttle Orbiter 2600 and NES stuff

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-05 00:00:00 UTC
From: tommage@aol.com
Message-ID: <19990205021450.06643.00001039@ng32.aol.com>
Source record: 55032

Well here is a list, the first ones are complete with box and manual and are mostly in great shape. I do prefer trades for stuff I need right now and I collect so deal most with other collectors. I need a Dragon Warrior 4 cart loose, DW3 with box only plus I will list more stuff I need after the NES games I am trading (much classic computer stuff). SO is listed below the NES stuff too :)

These have original box and manual

TMNT 2
TMNT 3
Vegas Dreams
Megaman 5
Caesar's Palace
Conflict, map too
Bucky Ohare
Afterburner
Roger Clemens Baseball
Bubble Bobble 1
Bart vs the World
X-Men
Mike Tyson's Puchout
Legacy of the Wizard
Snake Rattle and Roll
Sword's and Serpents
Star Trek 25th
Wizardry 2
Big Nose the Caveman
Dynowarz
Dragon Warrior 2 w/box/manual/map
Faxanadu
Family Feud
Jeopardy
Kiwi Kraze
Narc
Operation Wolf
Prince of Persia
Rygar
Ultima Exodus
Romance of the 3 Kingdoms

Games with box only

Spiderman and Sinster 6
T2 Terminator

Felix the Cat
Jurassic Park
Mickey Mouse Letter B
Shinobi
Tiny Toons 2
Batman
Little Mermaid
Dragon Warrior 2
Empire Strikes Back
Gauntlet 2 w/manual no box
Snow Bros.
Super Mario/Duck Hunt w/manual, no box I need at least $1,000,000 for this one
Ultima Exodus manual, no box
Venice Beach Volleyball cart only some label damage

Oh, I have a loose 2600 Shuttle Orbiter to trade too, would like another UR 2600 cart for that one or maybe some of the classic computer games I need. Here is a list of some stuff I want.

I will trade for complete 3DO Lucienne's Quest, Saturn Magic Knight Rayearth or PSX Lunar Complete. PSX Ogre Tactics, Tomba, PSX Tecmo's Deception. Am interested in any newer PSX RPG I don't have. Loose Dragon Warrior 4 NES cart or Dragon Warrior 3 cart with box. Complete Squaresoft version of Final Fantasy Adventure, Sqauresoft realease only, not Sunsoft. Must have box, manual, map and cart in good shape. Loose Lufia 2 for SNES Also will trade for the following computer games.

Ultima by California Pacific only made for Apple][(will buy or trade for pieces of this game also)

Akalabeth by California Pacific (same as above)

Ultima Escape from Mt. Drash (only made for VIC20, will consider incomplete games too, even just the box or manual.)

Ultima I by Sierra only made for Atari 8-bit I think (need pieces of this game too).

Ultima II, I need the big box, it measures about 8x11". I need mainly the box, but will buy/trade for complete games too. I especially need the IBM version.

Ultima II small box version C64 with black border on box. And small box Macintosh and IBM Ultima II.

Dark Crystal by Sierra

Infocom items listed below with descriptions, measurements are in metric (mm). Any computer is ok for these.

The Personal Software version of "Zork I" was simply called "Zork". It came in a 226x320x5 plastic zip-lock bag containing the disk and a 36-page booklet.

The Infocom version of "Zork", before it was renamed "Zork I".

Zork I-III blister pack [i.e. card with plastic tray] 158x249 for 5.25" disks, 238x256 for 8" disks [nothing except piece of paper with instructions]

Starcross 304x306x45 flying saucer 1. space map 2. instruction booklet

Suspended 240x317x70 box with recessed white face mask 1. instruction booklet with congratulatory letter 2. laminated colored cardboard map (600x230x3) of the Underground Complex (folded once) 3. six robot tracking devices (flat black round plastic chips) 4. plastic mask

Any of the slipcased Infocom Trilogies, must have the slipcase. Mystery Collection, SCIFI Collection or Enchanter Collection.

Did anyone make it this far???? :)

Thanks,
Tom

It occurred to me that Steve Judd wrote in comp.sys.cbm:
>
> When I cover one eye, the world does not lose its 3D appearance.

Euhm... Due to a weird problem with my eyes, I cannot see with
two eyes simultaniously. (In a nuttshell) Never could, actually.

But I do agree that there is still a hint of 3D in my point of view;)
Getting a drivers licence poses a bit of a problem, since I can't
see in a glimpse how fast that oncoming car is driving ;0

Stereoscoping thingies are totally wasted upon me, though.

> more like 50% wider than an Atari "sprite".

That's only if you want multicolour sprites. Aren't PMGs only one
colour?

> (C64's 12 pixels across vs. Atari's 8 pixels across).

Only in data width, the physical width of the sprite is still 24 pixels
because C64 multicolour pixels are two hi-res pixels wide.

Peter:
> True, but you can always overlay the players and there is a mode which
> allows you to get extra colours when players are overlayed (I'm a bit

> in the technical manual).

So you have five PMGs (well, if the missiles all work together) and in
order to match what a C64 can do you have to overlay three of them and
expand horizontally. And that's still only two thirds of the width of
one C64 sprite.

Jason =-)

I can't agree with that, on the C64 it's a trivial job to raster sprites
and fairly trivial to multiplex. It also meant that the Atari sprite
handling *had* to be done from machine code but the C64 could, if you
didn't mind slightly sluggish movement, move sprites from BASIC.

Aaron:
> It's interesting that the C-64's advanced hardware sprite movement
> ability was about on par with the Atari's background bitmap hardware

> strengths.

Heh. The C64 can move a bitmap like that, but it's not exactly a
documented feature of the VIC-II... =-)

Peter:
> Nice one.... :-))

Actually, that's how we do it. There's a little known routine in the
kernel that allows a small "bug" to sneak up the video cable with a
screwdriver and... Why are you looking at me like that?!

> But seriously, I've been curious about this bug in the VIC II for
> years and would love to know how it's done.

You need a steady raster to get this right but the basics go like this:

One cycle to the left of the right hand border, switch on horizontal
smooth scroll. Then switch it back off again. The C64 is fooled into
thinking it's already turned the borders on for that line and doesn't do
it.

But you need to perform the same trick for *every* rasterline you want
open and don't forget to time for any sprites moving over them.

Let's just say upper and lower borders are easier, shall we? =-)

You can overlay 2 Atari PMG's and 'mix' the colors for a third. Ie, yellow & blue would get you green on the overlap.

Seeing 3D with monocular vision is not an "illusion." First, our eyes
(or eye) are in constant (twitching) motion which causes the
perspective to change ever so slightly (note: this twitching is
necessary because, believe it or not, our retina would lose
sensitivity to a completely fixed image). Also, our bodies and head
are always in motion. This also produces a change in perspective.
Hence, 3D with one eye is definitely a true experience.

>
> Actually they published a magazine called "Page 6" for about 10 years before
> coming out with "Atari User", I've still got a few copies hanging around
> somewhere....

Well not quite... To begin with there were 2 magazines, Page 6 and
Atari User (UK), both produced by different people. Then the Atari User
people decided to stop production. Rather than let the name Atari
User disappear, the Page 6 people bought it from them. So Atari User
goes out of production, and Page 6 change their name to Atari User.

However this caused confusion with the newsagents who sold the
magazines, who thought that Page 6 had been taken over (rather than
the other way around), and Atari User had gone out of production, hence
no Atari 8-bit magazines to sell. A couple of issues later Page 6
remedied things by changing the name of the magazine from Atari User
to New Atari User, which is the name they still use today.

So... Page 6, Page 6/Atari User, and New Atari User are all the same
magazine, and the old Atari User was a completely different magazine,
produced by different people. Page 6/New Atari User is still a good
magazine.

What I said applies to "physical width." The Atari's "sprites" are 8
color clocks wide (in monochrome). The C-64's sprites are 12 color
clocks wide (in 3 colors). Hence, the C-64's sprites are physically
(actually, VISUALLY) 50% wider. Here's some more specs concerning how
C-64 sprites can be manipulated:

* 12 color clocks wide in 3 colors
* high-res monochrome (one color) option at 24 bits wide at 2 pixels
per color clock (Atari sprites cannot achieve this high resolution)
* A C-64 sprite can be "stretched" 2x in both the horizontal and
vertical (Atari sprites can accomplish this with the added ability to
4X the horizontal so that each pixel is as wide as a text character)

Only two Atari PM sprites must be overlayed to produce 3 colors.
Combining the two can be set to produce a new 3rd color (XOR?) based
on a "mix" of the two main colors (which are set by their
corresponding color registers) . Unfortunately, you are right...this
reduces the number of physically separate sprites on the same
scanline.
>

>> positioning.

Yes and no. Normally, an atari program doesn't use the entire height
of a player. Data movement can, therefore, be a subset of an entire
player (moving a 10 byte tall pacman character would only require
moving 10 bytes...not the total 256 byte Player height).

I mainly agree with your assessment of the Atari PM limitations (vs.
C-64's sprites). However, by taking advantage of how Atari BASIC
character strings can be manipulated, Atari Players can easily be
moved in the vertical with a single BASIC statement. Horizontal Player
movement only requires updating a single hardware register. Not a
single MACHINE LANGUAGE instruction is necessary for fast Player
movement.

I've been trying to understand this "undocumented C-64 feature." It
still appears to require ALOT of work (in coding and processor time).
And in the end, "BYTE BANGING" still becomes necessary.

Where is this new data being fetched from? The next graphics line? Are
any graphics being repeated? Sounds like this technique (if used in
full screen) wastes at least 50% of the C-64's CPU. Wouldn't it be
better to just use sprite graphics within the boarders?

Naaaa na naa naaaa na . Atari's support 32, 40, & 48 columns with a
simple hardware register poke. 48 column mode completely gets rid of
the borders in the horizontal direction. Boarders in the vertical
direction can also be eliminated just by defining a larger display
list. Kludgery is fun, but simplicity is a relief. =-)

> appearance.

This is getting way off topic now, but...

Binocular vision (the 2 eyes thing) is one of the factors involved in making the world look 3D, but it is not the only one. Other things like apparent size of an object (a person standing 10 meters away looks smaller than a person at 1 meter), paralax (like paralax scrolling in video games), focusing distance (how hard your eyes have to strain to focus on the object), vanishing points (if extended parallel lines appear to converge at a point a long way away), and others, also influence things. So even with one eye, your brain will compensate, and the world will still look 3D. Not all these have equal influence though, and the influence each has does vary depending on what you're looking at and how far away it is.

So the world *does* look 3D with only 1 eye, but of course, it won't be *quite* as good as with 2 eyes. For the most part though the differences between 1 and 2 eye viewing is small.

It occurred to me that Aaron wrote in comp.sys.cbm:

> Interesting. Tell me more of your problem.

Nothing spectacular - One eye that won't need any correction, one
that needs a fairly big correction -> different sized images ->
no way to overlap them -> No 3d vision.

Actually, if one would want to make me go beserk, give me a pair
of glasses that matches the correction needed for both eyes. Instant
headache assured.

You believe wrong. Gr. 9-11 support was in the 8-bit Atari OS from the
very beginning.

Some pre-GTIA programs that used Gr.8 artifact colors
would trick the OS into thinking it was in a GTIA mode so they could use
the built-in line draw function to draw in "solid" artifact colors (albeit at
80x192 rez).

At least in the horizontal direction, the Atari's can fine scroll up
to 4 characters before any pointers have to be changed. (16 color
clock scroll divided by 4 color clocks per character equals a 4
character scroll). I believe an Atari screen can be fine scrolled
vertically up to 16 rasterlines (this would make sense because some
Atari character lines are up to 16 rasterlines tall).

The C-64 finescroll register can only finescroll a single character
width or height. Of course, one C-64 advantage is that finescrolling
is at a higher resolution in the horizontal direction (half a color
clock change vs. the Atai's whole color clock change).

The reason why the Atari hardware engineers chose a full color clock
is that movement in less than a full color clock introduces strange
color artifacting in the graphics. Fast horizontal fine scrolling on a
C-64 can cause a strange color fading/glittering which causes
epileptic fits in some people. (About 10 years ago, there was a big
media scandal about this concerning the old NINTENDO game machine).

I've experimented with interlaced color combinations on the Atari. The shimmering you refer too can only be eliminated (nearly) if the luminance of the two colors is the same. I would suspect that this shimmering is more of a problem with the C-64 due to it's much more limited color selection, Still, the use of COLOR ARTIFACTING on the C-64 would be much more successful than the Atari (color artifacting is achieved by turning on half a color clock) but only if the connected monitor is video in only (as opposed to the higher res CHROMA/LUMA separation).

No, they're not. The 12 pixels are still three times the width of an 8
pixel PMG. C64 sprites don't magically shrink because you go into
multicolour mode, the multicolour pixels are *twice* the width of
standard pixels so visually it takes the same space as a monocolour
sprite.

> Here's some more specs concerning how C-64 sprites can be manipulated:

This is a tad like taking coals to Newcastle, Aaron. I've been coding
for nearly 14 years and have a pretty reasonable understanding of how
C64 sprites work. PMGs are a different matter, it's been over ten years
since I was using an Atari.

Jason =-)
> So you have five PMGs (well, if the missiles all work together) and in

Whoops, sorry. It's been a while and I'd forgotten about that.

> Unfortunately, you are right...this reduces the number of physically
> separate sprites on the same scanline.

To two (not including the missiles) and they're still only a third of
the width of a C64 sprite, just twice the resolution.

Jason =-)

Not quite right, I was closer. For an 8x8 object you have sixteen
memory writes. Eight to clear the old image and eight *more* to write
the new. For a 24 by 21 pixel high object that's 3x21 bytes (63) x 2
because you have to clear it, so 126 transfers.

Jason =-)

But a fraction of the amount that would be required to move an actual
bitmap. It's possible to move 8 pixels a frame on X and Y
(independently) at 50 frames a second.

There isn't any new data, it's an empty area the same colour as the
background...

> Sounds like this technique (if used in full screen) wastes at least
> 50% of the C-64's CPU.

Actually, it's more like 80% on an NTSC machine and 65% on PAL.

> Wouldn't it be better to just use sprite graphics within the
> boarders?

The sprites can't go *into* the borders unless you're doing this. This
is *why* it's such a big deal when it's done well because the timing is
a *bastard* when you're moving the sprites vertically and the changes to
$D016 *have* to be cycle accurate.

You were born just a few years too early. It shouldn't be very
long before we can make computerized glasses that can correct
an image without changing its size.

>
Eeeewwww a challenge. Let's see (without using a calculator):

2^16 would be 65,536 in decimal? $10000 in hex?

$C000 would be......hmmmmm.....this'll take a moment.....
...$C is equivalent to 12. 12 multiplied by 4096 is......
...40960+8192=49158...WOULD THE ANSWER BE 49,158 IN DECIMAL?

63*312 is a little bit tougher.....let me think about it..lot's of
ways to calculate this one in my head....(Jeopardy music, please)

...in a 16K address space there can be 256 64 byte regions....no,
I've got an easier way. 63x300= 18,900 and 63x10=630 and 63x2=126.
Add all three of these numbers and you've got 19,656 in decimal. Am I
correct?

This took a little longer than I thought it would. Guess I'm not as
intelligent as I thought. =-(

I'm board. Not going to bother checking my answers. I'll leave this
job to others. Please feel free to flame me if you wish. I'll make a
semi-serious attempt at ignoring 'em.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

Someone else will probably jump in here too, but there was a different technique that was IMO a tad bit<sic> more popular. A little more code involved since IIRC you had to determine the direction of the move first, but you would define you player as the actual height and add leading & trailing zero bytes to the definition so the player would be self erasing as you slid it though memory. A single byte high chr would be [0, $55, 0], a two byte high chr would be [0, $55, $85, 0].

Vertical postion registers would have made life a lot easier.

How embarrassing for you, it's 49152. =-)

(That said, I have it memorised because Zeus 64 assembler sits there,
which is what I work with...)

> PC-2." Of course, you'd have to have some pretty huge pockets
> (8" x 2" x 1").

Ummphh! One inch thick? Whee! The one that I had, before it was
embedded in to someone's derriere was only 1/8" thick. IIRC it was
6x3x1/8. It slipped nicely into my pocket.

> Those things were really ahead of their time. Although the

Now, I had no sound on mine. No interface of any sort, either, even
though it was capable of accomodating one. I had macros available, but
I think I had a max of about 4K.

From: Russ Brown <russb@io.com>
Message-ID: <79ger3$g4i$1@hiram.io.com>
Source record: 55067

It's already on my list. But I wonder if hardware isn't easier.

It seems to me that an adaptation of UTIL or MYUTIL for writing shouldn't be all that difficult, provided you have the specs for the ATR format. But I imagine that debugging such a program would be a nightmare.

If I have time, I'll give it a whirl and post my progress. My target would be to write a 180K disk, since I know my drive (1.2M 5.25" Intel Atlantis MB controller) can read those. Single density is toast--no program to read them that I tried worked, even partially. I haven't tried dual (1050) density.

I grew up on the Atari and know the IBM PC well, but the mystical art of interoperability is a new concept to me....

No kidding about thickness. Mine definitely goes in the backpack.

The plotter/cassette interface was really a mixed deal. Plotter was really cool (send it x and y and the color to use to get there and it would draw a line). Cassette interface was so lame as to be nearly unusable.

Tandy/Radio Shack was definitely a model of human brilliance and fallibility in those days. Remember CoCo?

Liked VIM until I was assimilated. Resistance is futile.

> Changing power-regulators
Mathy,

It is ofcourse possible to use other regulators in the XF551/1050, but this will only help a little bit. You still have to drop about 10VDC, and this is not the same as the methode used to convert 38KV AC to 220V AC.

AC can be transformed by transformers. DC won't work due the non-pulsing voltage, so it doesn't create a changing magnetic field to bridge the gap between the two copper-coils.

Also, in theorie, the power in Watts at the input of a transformer is the same as at the output. When transforming a high-voltage to a low voltage, at the low side, you can drain more Ampere's, and reverse...

P=U*I , where P=Power, U=Volt, I=Amps.
So, when P must be the same, and the U goes lower, I must increase...

A power (voltage) regulator as used in the XF551 does nothing else then turning the "too-much" voltage into heat. This is cause the output had to stay stabil when the input changes a bit.
I think "stabilizer" is a better word to use then "power-regulator"...

1809. Wanted: Info on RamMaster 256K upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-06 00:00:00 UTC
From: morloc <morloc@acd.net>
Message-ID: <_k0v2.1149$1a1.26434@newsfeed.slurp.net>
Source record: 54940

I have a Rammaster 256K upgrade sitting here and no clue as to how to hook it back into the 800XL system it came with. The 256K ram chips are already installed, too, so this is nothing more than a tease to someone who's antsy to get this qmeg XL up and running.

Does anyone have any clues as to how to hook it into the system?

TIA,
morloc

Mike Hohman released Spartados 3.3 as shareware. So it's legal to download
but I don't think there's any way to register it. When Fine Tooned was in
business, for $19.95 you could get a copy of the Spartados manual.

Marek Pavlik:
> Hi.. you are wrong. If I did well understand the C64 sprites in
> multicolor mode has 12 pixels across in resolution like graphics
> 160x200.

This is where the confusion comes from, the C64 screen is *always*
320x200. A multicolor sprite is 24 pixels wide but displays like a
160x200 image with 12 pixels across. Physically, however, it is *still*
24 pixels across and can be positioned horizontally and vertically at
any position in that 320x200 area.

Just putting sprite multicolour mode on *does* *not* affect the screen
resolution so the sprites are *still* 24x21 pixels in size and *still*
are three times the width of a player.

Unless someone forgot to mention that players double in width when two
are overlaid there is no ambiguity here.

Check the power supply is giving a good solid 5vdc

> Well, Today I bought an Atari tape drive (I thought I might be able
> to use it with my aquarius) for ten bucks,

It's very doubtful the tape drive will be compatible with anything other than an Atari 8-bit (a bit of special circuitry makes them different from other cassette drives. They were never worth spit with the Atari anyway.

> Should I just give up and buy a new atari 8-bit, or is there anything
> I could possible do to repair....

If the power supply is not the problem, you'd be better off buying a 800XL or a 130XE. They come with far more RAM, run far more programs, and can be easily expanded once you discover hoe good the A-8 computers are. Keep the 600XL for parts--especially if the chips are socketed.

Hey Russ,

I have a question for you regarding disk sector numbers. Since standard floppy drives have two heads, how is the sector numbering set up? is "side 2" a continuation (number wise) of side 1?

Also, how does DOS (IBM) know WHERE a sector is located on the disk? Is it just the sector # divided by 18 (or the # of sectors per track) to get the track #, or what?

thanks Tony

YES. Each bit can control either 1/2 a color clock (for smallest pixel
size) or a full color clock (for a lower res, wider pixel)

>3. In color mode, each pair of bits controls 1, 1
>color-clock-wide pixel (12 pixels across).

In (3) color mode, each bit pair controls either a full color clock
or, in a stretched mode, 2 whole color clocks. There is no provision
for a finer 1/2 color clock mode.

I seem to remeber having a problem where I spilled Coke (I was 15 or 16 at the time) in the keyboard while it was on and toasting the C-64. Sent $55.00 dollars and in about two weeks received a new computer (it was way out of warranty). Just try to do that today.

PMG. C64 sprites don't magically shrink because you go into
> multicolour
mode, the multicolour pixels are *twice* the width of
> standard pixels so
visually it takes the same space as a monocolour
> sprite.

Uh, waitaminit.
Let me see if I have this whole C64 sprite business
straight:
1. C64 sprites
are 24 bits wide.
2. In mono mode, each bit controls 1, 1/2 color-clock-wide
pixel (24 pixels across).
3. In color mode, each pair of bits controls 1, 1
color-clock-wide pixel (12 pixels across).

Since Atari P/MGs are 8, 1
color-clock-wide pixels across, and half of 8 is 4,
and 4 is the difference
between 8 and 12, then it would indeed appear that
C64 sprites are 50% wider
than Atari P/MGs.

Have I missed something here?

> Aaron:
> > Only two Atari
PM sprites must be overlayed to produce 3 colors.

>
> Whoops, sorry. It's
been a while and I'd forgotten about that.

Or you can use a DLI or display
kernal to change the color every scan line,
for 128 colors per sprite (grin),
but that's a whole 'nother can of worms.

> > Unfortunately, you are
right...this reduces the number of physically
> > separate sprites on the
same scanline.

I've seen some demos that actually use the SAME sprite twice
on the
same scanline, by restuffing the horizontal position register. Is the
same
thing possible with the C64?

> Not quite right, I was closer. For an
8x8 object you have sixteen
> memory writes. Eight to clear the old image
and eight *more* to write
> the new. For a 24 by 21 pixel high object that's
3x21 bytes (63) x 2
> because you have to clear it, so 126 transfers.

That's
only for an arbitrarily-placed player. If you can, for example, assume
that
the player will never move more than a single scanline vertically at a
time
(a fairly common situation), you can move an 8x8 player vertically with
only
10 writes-- 8 bytes of shape data, plus a leading and trailing "blank"
write.

1820. Re: Atari and Commodore vs. TODAY'S PCS!!!

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-06 00:00:00 UTC
From: Anthony Baker <antbaker@arn.net>
Message-ID: <36BBF439.D6EDB158@arn.net>
Source record: 55077
Cross-posted to: alt.c64,comp.sys.atari.8bit,comp.sys.cbm

We all must stop the bickering about which old 8-bit system is better
than any other old 8-bit system and think about the common thing that we
all love (and still love) that bring us back to the old systems.

Simplicity with power!

I remember the good old days, if you needed a drive, modem, or whatever,
you knew exactly what would work w/ your system and what wouldn't. If
you saw a 1050 in the store that said Atari, you knew it worked for all
Atari 8-bits.....period...true plug and play.

Nowadays, you have to worry about communication of devices, w/ drivers,
and OSes. IDE vs. SCSI. Generic style cases vs. custom. For example,
I am fixing to buy a new 10 gig. HD and I am basically having to go
through all my tech manuals for my computer to make sure I have absolute
compatibility.

Right now, I wish I could just plug it in an turn it on w/o having to
worry about it blowing up my computer or getting ruined in the process.

So, instead on dogging on pretty much equally powerful machines, lets
compare them to how useful they still are compaired to PCS.

DON'T think I am just talking about Wintels! I love Macs even more than
my PC but until recently Macs were UNGODLY hard to upgrade.

Laters,

If you were not joking you would be an obvious liar. A lot of Commodore hardware was purchased from places like department stores which would honor Commodore's warranty (i.e. if something went wrong you could exchange the unit with a brand new one). This kind of support is almost allways if not allways automatic with Commodore hardware..

You're way behind the c64 times dude - the cmd hard drives have been out for allmost a decade now and with jiffydos and/or ramlink and/or supercpu it can easily transfer over 50k per second on a c64. And basically no precious memory is taken up by a special wedge because it is built into the operating system from what I understand.

Up for bids on ebay through Sunday evening. 2/7/99

ATARI 800XL in very good condition, with power supply Rf cable SIO
cable WICO Boss Joystick and 9 video game carts!

Centipede, Missile Command, Donkey Kong, Space Invaders,
STAR WARS, Pac-Man, Atariwriter, Ms. Pac-Man, + Basketball.

See a PHOTO and a complete description at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=63926988

Thanks for looking!

I hope I formatted this right, Earl. It took a little time to
reassemble it, your software forgot to send return codes...

Earl Halliwell:
> Uh, waitaminit. Let me see if I have this whole C64 sprite business
> straight: 1. C64 sprites are 24 bits wide.

Yup. They are also 24 pixels wide.

> 2. In mono mode, each bit controls 1, 1/2 color-clock-wide pixel (24
> pixels across).

I have no idea what it meant by "color-clock-wide" but yes, they're 24
pixels across.

> 3. In color mode, each pair of bits controls 1, 1 color-clock-wide
> pixel (12 pixels across).

No, the pixels fatten out, so the area covered is still 24 pixels.

> Since Atari P/MGs are 8, 1 color-clock-wide pixels across, and half of
> 8 is 4, and 4 is the difference between 8 and 12, then it would indeed
> appear that C64 sprites are 50% wider than Atari P/MGs. Have I missed
> something here?

Mono and multicolour sprites are the same width as each other (24
pixels). Mono and mixed colour (sorry, don't know the technical term)
PMGs are (I assume) the same width as each other (8 pixels).

Okay, I'll draw a diagram. Please use non-proportional fonts! =-)

C64 mono xyxyxyxyxyxyxyxyxyxyxyxy 24 pixels across
C64 multi xxyyzzaaxxyyzzaaxxyyzzaa 24 pixels across
Atari 1 PMG xyxyxyxy 8 pixels across
Atari 2 PMGS xyzaxyza 8 pixels across

See? =-)

> I've seen some demos that actually use the SAME sprite twice on the
> same scanline, by restuffing the horizontal position register. Is the
> same thing possible with the C64?

No, the max the system can handle on a line is the 8 sprites. But since
the Atari would have to reproduce it's players a total of four times
across the screen to match a C64 in multicolour sprite mode (and even
then, as explained, the sprites are only a third of the width)... =-)

> For an 8x8 object you have sixteen memory writes. Eight to clear the

> vertically at a time (a fairly common situation), you can move an 8x8
> player vertically with only 10 writes-- 8 bytes of shape data, plus a
> leading and trailing "blank" write.

Well yeah, if you want to impose a speed limit on your sprites,
personally I tend to move everything at between two and four pixels a
frame. And the max speed the clear trails can do before becoming
redundant is under 50% of the sprite's height, if it's 8 pixels high and
you want to move it four pixels that's going to *still* need sixteen
writes, four above and four below.

If you're looking for a disassembler for your Atari, try ASI, its
available at:
http://www.geocities.com/SiliconValley/Lakes/7953/8bit/asi.html
in DCM and XFD formats.

It's also available at the umich archive under:
http://www.umich.edu/~archive/atari/8bit/Languages/Assembly/asi15am.dcm

Hi.. you are wrong. If I did well understand the C64 sprites in
multicolor mode has 12 pixels across in resolution like graphics
160x200. Atari PMG has 8 pixels across in this resolution so the C64
sprites are 50% wider.

> >> 2) They are so *blasted* expensive
> >>
> >>
>
> Yes I agree with you there. Although windoze ce is better than
> windoze itself.

That may or may not be true. But as for me, I don't see the "CE",
"3.1", "3.11", "95", "98", "NT", or "NT4". All I see is WinBloats. It
is just a GUI that causes a lot of problems and hides what is really
happening.

For just the same reason, I never cared much for Geos. I occasionally
used GeoPaint, but I hated GeoWrite. SpeedScript is much better for my
purposes. SpeedScript runs from the command-line, which is much
easier. With GeoPaint or GeoWrite or any other Geos-based software,
you have to run up Geos first, *then* load the desired program.

Again, just another GUI. Not that I mean to slam other computers, but
that is the main reason I never tried a MAC, *because* of the GUI.

My son's xmas present was a 330 PII. Much speculation about my abilities
to assemble PCs since the standard response when you say you have
problems it ~you don't know what you are doing.

Anyway, thing crashes while playing Free Cell, not to mention several
other pretty standard programs.

If you want to set up a news appliance type device, Linux is the way to
go. I don't have a lot of experience with Xwindows, but the standard
programs you expect to work with a net capabile machine, like
newsreaders, email, etcetera work better then you could imagine.

When they ran the 'Mathmatica' speed trials, something like 7 of the top
10 machines were Intel boxes running different flavors of Linux. Windows
just made the list with a couple of Macs scoring well.

You may want to get the latest version you can on CD, like Red Hat. My
son finally converted to a Linux head after ~10 years of nagging Unix at
him & he sees it as the only really good solution to his network
problems.

You can use the cables designed for the 8-bit Commodore machines. Another option is a DIN-to-RCA adapter; Radio Shack used to sell one for about $5.

For a while you could buy a "TransKey" kit which would do the trick but I believe the company (Dataque) is defunct. IIRC it used around 10 IC's and certainly was not cheap. Still... sure wish I had one--the only thing I've really grown to hate on the XE is the keyboard.

Bob Wooley or one of the other hardware gurus Jwould most likely have more info.

I've got a broken atari 600xl, which when turned on just displays a horizontal white line and makes funny noises. I wasnt too concerned about this, seeing as how I got it for free. Even so, I took it apart and noticed that the board had white deposits over everything. I cleaned it up but it still wouldnt work, so I gave up. Well, Today I bought an Atari tape drive (I thought I might be able to use it with my aquarius) for ten bucks, So now I'm motivated to fix the 600xl so I can use it. Should I just give up and buy a new atari 8-bit, or is there anything I could possible do to repair, or that anyone can do (I know a place that can do that type of stuff, expensive though...) to repair the beast.
Thanks for your help
Chris Collet

You really like to play fast and loose with the terms. =-)

In terms of sprite movement & fine scrolling, you are right about the
C-64 being locked into 320x200 resolution. In terms of the various
color modes, the C-64's color resolution can be locked into 160x200.

>Just putting sprite multicolour mode on *does* *not* affect the screen

>I have no idea what it meant by "color-clock-wide" but yes, they're 24
>pixels across.

Color clocks are very important to understand. I should have more thoroughly explained it with my initial message.

Color on a monitor (or TV) screen is achieved by mixing 3 (positive) primary colors: RED, GREEN, & BLUE.In order to produce white, all three primary colors must be turned on. Grey levels are achieved by varying the intensity of all three PRIMARY COLORS equally. Unequal intensity changes (ie. higher intensity of one PRIMARY COLOR over another) produces other colors.

Each of these 3 primary colors are physically separated from each other on the display screen but are so small that the human eye cannot see them individually. To see the primary colors, use either a magnifying glass or, believe it or not, just spritz water on the display. (it is easier to see them on a completely white display) They are usually positioned in a triangle where each of the three imaginary points of the triangle contain one of the three colors. These are known as COLOR TRIADS.

Increasing the number of COLOR TRIADS within a given area of the screen also increases the apparent resolution (usually referred to in PC circles as DOT PITCH). TELEVISION displays & COLOR COMPOSITE monitors contain only a small number of these TRIADS while high resolution SUPER VGA COMPUTER MONITORS contain many times more in within the same area.

In order to freely control the color of a pixel on the screen, a computer *MUST* produce a pixel that contains at least one whole COLOR TRIAD. If the pixel is smaller than this, then the color of the pixel is not guaranteed.

What does this have to do with COLOR CLOCKS? Read on.

Atari & Commodore 8-bit computer's normal color (non-text) display resolution is 160 pixels across. Each pixel happens to correspond with one complete COLOR TRIAD or *COLOR CLOCK*. Both computers also support a higher resolution (usually used for TEXT display) which contains exactly double the number of pixels per horizontal line (320 pixels vs. 160 pixels). Unfortunately, in this hi-res mode, each pixel does not contain a full COLOR TRIAD, and, therefore, strange COLOR ARTIFACTING can occur if less than two sequential pixels are turned on. (Some ingenious programmers have taken advantage of COLOR

ARTIFACTING in order to produce more colors than the C-64/Atari
hardware normally supports.)

Atari Player Missile (or PM) "sprites" have been "locked" so that each
PM pixel corresponds to a whole COLOR CLOCK. C-64 SPRITES in 3 color
mode are also "locked" so that each pixel (consisting of two bits)
equals one whole color clock. However, unlike Atari PM SPRITES,
Commodore 64 SPRITES in monochrome (one color) mode can be set so that
each pixel is only half a color clock wide (half the width of an
Atari PM pixel). This effectively means that C-64 SPRITES (in
monochrome only) can be double the resolution of an Atari sprite.

>> 3. In color mode, each pair of bits controls 1, 1 color-clock-wide
>> pixel (12 pixels across).
>
>No, the pixels fatten out, so the area covered is still 24 pixels.

NOPE! When the C-64 sprites are in three color mode, each pixel is
controlled by 2 bits within the 24 bit wide sprite. In this mode a
C-64 SPRITE is 12 pixels wide. NOT 24!!!!
>
>> Since Atari P/MGs are 8, 1 color-clock-wide pixels across, and half of
>> 8 is 4, and 4 is the difference between 8 and 12, then it would indeed
>> appear that C64 sprites are 50% wider than Atari P/MGs. Have I missed
>> something here?
>
>Mono and multicolour sprites are the same width as each other (24
>pixels). Mono and mixed colour (sorry, don't know the technical term)
>PMGs are (I assume) the same width as each other (8 pixels).

C-64 SPRITES, either in mono or three color mode, are the same
physical width. However, the physical width of one three-color sprite
pixel is equal to the physical width of two mono-color sprite pixels.
Both SPRITE modes can also be "STRETCHED" to double width (but with
the same number of pixels).

>Okay, I'll draw a diagram. Please use non-proportional fonts! =-)
>
>C64 mono xyxyxyxyxyxyxyxyxyxyxyxy 24 pixels across
>C64 multi xxyyzzaaxxyyzzaaxxyyzzaa 24 pixels across
>Atari 1 PMG xyxyxyxy 8 pixels across
>Atari 2 PMGS xyzaxyza 8 pixels across
>
>See? =-)

NOPE!!

C64 mono (single x equals width of one pixel)
xxxxxxxxxxxxxxxxxxxxxxxx

C64 three-color (two x's equal width of one three color pixel)
xxxxxxxxxxxxxxxxxxxxxxxx

Atari Sprite (two x's equal one bit as well as width of one pixel)
xxxxxxxxxxxxxxx

Both Atari & C-64 sprite hardware can STRETCH their respective sprites
in both the horizontal and vertical direction so that they're double
the original width and height. Atari Sprites can also be QUADRUPLED
(but only in the horizontal direction). However, since the amount of
data contained in the sprite is the same, the individual pixels become
very blocky.
>> I've seen some demos that actually use the SAME sprite twice on the
>> same scanline, by restuffing the horizontal position register. Is the
>> same thing possible with the C64?
>
>No, the max the system can handle on a line is the 8 sprites. But since
>the Atari would have to reproduce it's players a total of four times
>across the screen to match a C64 in multicolour sprite mode (and even
>then, as explained, the sprites are only a third of the width)... =-)

As I said above, Atari sprites ARE NOT A THIRD OF THE WIDTH
(physically).

(Asks Russ about sector numbers and how DOS locates a sector.)
I dunno which Russ you're talking to, me or Russ Brown or
some other Russ. Rick (Cortese) would be a better person to ask.
I don't know what the sector number arrangement is on double
sided A8 disks. They are sorta rare as only the xf551 could
do double sided, and maybe some Trak or Percom or something.

As for how PC DOS knows where a sector is, there is data
before the actual sector data that helps the controller
locate a sector. You can look at this 'timing' data
with ANADISK. There's a crc for the sector, gap bytes,
address bytes, and other stuff in the inter-record
gaps that the controller uses.

Maybe Rick will explain it.

Yeah but...

The PC keyboards are so vastly superior to (especially the XE) those on
the Atari-8, it'd be worth the extra effort.

And...

PC keyboards don't have those tacky, pastel buttons :^)

Essentially the same thing for Atari drives. As to the XF551: sectors
1-720 are on side A of the disk as for a 1050 but, sectors 721 to 1440 are
on side B and start closest to the hub. Apparently the layout was selected
by Atari to ensure the XF551 could maintain compatibility with
single-sided drives. The only problem is the hardest sectors to read for
any drive are those closest the hub because they're so much smaller
physically--so with the XF551, if track 40 goes bad on both sides of a
disk, you lose sectors 703-720 _and_ most likely all of side two.

I think the XF551 design team was probably the same one that decided to
run 80-column video through a joystick port "for compatibility".

I think we have different terms...

> In terms of sprite movement & fine scrolling, you are right about the
> C-64 being locked into 320x200 resolution. In terms of the various
> color modes, the C-64's color resolution can be locked into 160x200.

No it can't, even in multicolour mode, the smooth scroll is still the
same and monocolour sprites can overlaid. In multicolour character mode
you can *mix* the resolutions at will with *no* tricks. The screen is
always 320x200.

Jason =-(
> Unless someone forgot to mention that players double in width when two
> are overlaid there is no ambiguity here.

Aaron:
> I don't understand the above comment.

I'm beginning to understand where the confusion comes from, here. When
you're using two players together to make three colours, do you *have*
to drop into 160x200 or can you do it on the stock power up screen?

If it's the former, the C64 doesn't have this limitation, I've been
assuming the latter.

>Is it toast or can the keyboard be
>resurrected easily?

I hate to tell you, but it's tinker time... I don't know anything about the chips (I hope someone here that does, catches this and jumps in...) I've done a lot with my 800, compared to the XL's.. they're very sturdy... and forgiving... This is what I'd do...

I'd disassemble the 800.. turn it over.. take out the 4 screws... once inside, take off the shielding, etc.. keep track of the screws, and the order you're doing things... at teh very least.. carefully unplug the keyboard ribbon cable, clean the contacts... if you have a cleaner from Radio Shack, that's good.. ask what the othe's think about alcohol.. may leave a film.. or, try a pencil erasor.. carefully rub.. then re-install cable.. carefully... firmly... that may work... plug it in and try it... if not, try pushing all the chips.. make sure none are loose... the keyboard is tied into one of them... (I myself, would then take out each, one at a time, and re-install... over time, the pins can oxidize.. and loose contact..)

If that doesn't work... all your cables, chips, and boards are all cleaned up.. and installed properly... one of the other folks here may know which chip it might be...

Good luck.... give it s shot.. it's a good project.. well worth it!

B'rgds,
Vinnie

I think we are talking about visual width os sprites. C64 sprites on
TV will produce for example object 3cm across (in monocolor and in
multicolor). Atari PMG will produce on the same TV object 2cm across so
C64 sprites are visualy 50% wider... howgh :)

If I could afford it, I'd go to a Power Mac G3; they run circles around a PII at the same clock speed. I've played with an old Power Mac (66mhz and a 6100 or 7100 CPU). It could run Win95 using a software emulator and outperform a 75mhz Pentium running the same stuff sans emulation.

> the new Imac looks great...

Personally, I think the looks suck, the lack of a floppy drive is a pain and the keyboard is an Atari-type abortion where you cut out some keys to save a few cents.

> I had all that on my Atari..Should I go back... ... Ok, the modem was a
> bit slow..2400!

If you don't care about graphics on the WWW, get a Black Box or MIO and stick a 14k4 modem on it. The Black Box is the better of the two because the MIO will only handle (really old) 256-byte sector hard drives which are terribly hard to find. Then again, the MIO does give you an external RAMdisk which makes for really fast re-boots. For a few bucks more, look at adding RAM to your 486 and maybe going to a Pentium I--should be cheap now--with that you could easily go to Win95 if you need to (if nothing else good comes out of Microsoft, they did a really good job with Excel).

Well, I personally would go w/ a NEW power MAc G3 (the ones that look like an iMac on crack) because I love Macs. It's expensive as hell though. If you end up getting a PC, get a Dell or Hewlett Packard, hell, maybe even a Gateway 2000.

I have an Acer and I have liked it since I have bought it....until I wanted to upgrade the processor. PCs are like a dime a dozen these days (the ones you don't special order or build yourself anyway) and the reason for this is because they are designed to be inflexable "throw-away" computers. Sure you can plug in more mem., add a new hardrive and crap, but the motherboards are pretty custom to that machine.

That's why I went back to tinkering w/ my Atari. It wasn't designed to be upgradeable but there is and will only be specific Ataris. Why spend a crap load of time trying t tinker w/ a PC when you can get a new one for $900 something dollars.

What pisses me off also about PCs that they have a lack of, that I loved about the Atari computer, is that they knew the system had limitations and they made programs to optimize the hardware they had and did some pretty creative stuff.

Nowadays, obtimize? That's a curse word. Just get a computer w/ a faster processor, more mem., and a bigger HD. Even though we really don't need it it programmers these days (Microsoft) weren't so sloppy in thier coding.

I think if things continue the way they are, there is going to be a major info. overload. How fast is too fast?

From: Anthony Baker <antbaker@arn.net>
Message-ID: <36BDC1F0.DFA5FE6A@arn.net>
Source record: 54967

Hello all,

I already have a GANGLOAD of Atari stuff, but, it's all at my dad's house and I can't get down there until Spring Break to get some of it and I can't wait any longer:)...plus it is always good to have a lil' more extra:).

I already have a 130XE and XF551 drive but I want to buy another set. Here is my list:

Good condition, clean, working 130XE (hopefully one w/ a mem. upgrade).
" " XF551
SIO2PC cable
Manuals
Some Antic Mags. (I am looking for first issue to 1985).

Send me some prices, I am really interested. This is going to be for the good of the entire Atari community because basically what I am going to do is make some disk images and put them on my soon-to-be developed web page, and type out some lost Atari programs and stick them on there (mostly from Antic) for those people who were kicking themselves back in the day that they didn't get the software disks (oh, by the way, I have a ton of those I am going to make images of as well).

Also, could someone look into seeing if I could do that (scan old Antic mags. and stick them on the Internet) w/o legal trouble since I will NOT be profiting at any way and this is a service to the Atari community? I know it has been attempted before but I think the project fell through and I commend the person who at least attempt that daunting task.

I have had funny things happen too with flaky power supplies.
Maybe in your case the RF modulator is broken? On a 600 XL
it is hard to tell, since it does not have a video output.

Actually, having done lots of research on cassette stuff for the
Atari, there are lots of tapes that are bad quality. Sometimes it is
amazing that the Atari can still boot these sometimes. I suppose
there are more reliable ways to store data on tapes nowadays.
I am currently loading tapes at 820 baud, after cleaning them up
with a PC. People blame the unit, while in fact they should blame
the manufacturers of these bad tapes.
Anyway, $10 for a cassette unit? Sometimes you can buy a complete
system for a little bit more, so indeed repairing it is not worth
while most of the time. Just find yourself another used one.

Yep... I agree with you guys... (especially John and his headache analogy!)

The crazy thing.. I can keep what I've got.. upgrade the processor for about $100... buy a new modem... and, walla... or.. buy and Emachine.. box only for about $399... and try to reinstall all my stuff... hoping it'll all work... OR, run to something neater.. like a Mac.. I cannot understand WHY 40 meg... etc, is not enough! I got alot done with 48k... 540k I was in heaven! Jeez... why won't they let me get by with what I've got! The G-3 looks like an absolute monster....
B'rgds,
Vinnie

I think Windows 98 will work better for me than Windows 95 did. I wanted to
do the 98 upgrade, and in the process it made some of the partitions I had
created with Partition Magic and had "hidden" visible. And they were
bootable partitions! So I formatted the hard drive and started again. I
never saw anything run as smoothly as it does under 98, but that's just a
week old.

Meantime, the 130XE keeps chugging along ...

Vinnie, the only advantage I can see to a PC over a Mac is in terms of connectivity to the Atari. I null-modem back and forth between the two machines, and it saves me a lot of trouble. Whereas my Atari's modem is like yours (2400 baud) I can download files to the PC and then null them over to the Atari. Macs can do that just as well.

However, I don't believe there's anything like SIO2PC or APE for the Mac (guys, correct me if I goofed on this one.) The SIO2PC interface lets the PC act as a file-server (among other things) for the Atari. It uses .ATR files (Atari disk images -- of which the Pool Disk has tons) and has saved me many hours putting together the OHAUG newsletter. What's more, I can preview all of those disk images on the PC using any one of several emulators.

If you do get a PC, get one that's upgradable and configurable so that it will do what you want to do now, and what you think you'd want to do with it in the forseeable future. Same for a Mac. Personally, I see the Imac as intended to be a starter machine. From my standpoint, it looks flimsy (keyboard, CD-ROM drive especially) and with your computer experience you'd probably be happier with a higher-level Mac.

Vinnie, as I see it, the PC wins this argument in only one area --
connectivity to the Atari.

While both PCs and Macs can communicate with the Atari via a null-modem cable, only the PC (correct me if I goofed on this one, guys) can make use of something like the SIO2PC interface. I use this interface to have the PC serve files to my Atari from .ATR files (Atari disk images) that I keep on the PC or load in from the Pool Disk CD-Roms. I can preview those disk images on the PC using any one of several emulators. But the SIO2PC device, plus its software or A.P.E. has saved me many hours in putting together the OHAUG newsletter.

Back to null-modeming for a moment. This is also handy. There is a school of thought that buying either a Mac or a PC is useless if you can get a Black Box and a faster modem for the Atari. But if you absolutely need a PC or Mac, you can download with them at 56K and then transfer to the Atari via the null-modem connection at up to 9600 baud with an 850 interface or 19.2Kbps with a Black Box or MIO.

Between a PC or a Mac? Either way, I'd go for as configurable and upgradeable as possible. But the Imac is being marketed as a beginner's machine, and parts of it seem very flimsy to me. Comparing higher level G3s to PCs seems more reasonable.

>
> You *may* have a power supply problem. Do you get any wierd sounds
> from the monitor/TV speaker?

I first tried a different power supply (namely the power brick for my 1030 floppy drive), and that had no effect. I then took an oscilloscope to the motherboard and checked the power, ground, and clock signals on the various TTL chips (for which I knew the pin-outs); all signals seemed fine, with full swings between 0V and +5V.

I did notice, however, that the output of the actual clock crystal (CO61090) put out a rather messy 0 to 1V square wave with frequency 3.60-3.65 MHz. This doesn't seem to match exactly with the 3.57945 MHz listed for that part, but I'm sure the scope and the probe I used introduced errors. The actual amplitude of the raw clock signal probably wasn't a problem, since I saw perfect 0V-5V square waves on the clock inputs of several TTL chips, but if the clock frequency were skewed even slightly, I suppose that could distort the display image enough to fall out of sync with the TV.

To answer you second question, I get no sound whatsoever from the TV. Naturally, I hear a slight buzz when the turn volume up enough, but that buzz doesn't change when press reset, fiddle the joystick, or whatever.

Since I've already replaced the MPU, the memory decoder chip, and the actual memory, I suppose this leaves the Antic, the GTIA, and the Pokey. Oh well...

Thank you for replying.

Ah-hah! An Atarian spy visiting comp.sys.cbm.... (don't we still shoot spies?)

From the recesses of my brain, I seem to recall that the poke 55 & 56 were just to reserve memory. The 147 is a clear screen poke, and the 18 is probably a 'reverse' (change the charactor printed to inverse).

I just dropped out of the terminal mode to check, yes... the chr$(18) changes a charactor to it's reverse.

Someone will probably jump in to correct me if this is wrong... hope it helps. (Even *if* you're a vile Atarian spy... I guess you're still an 8-bitter...)

And just as I start to post this, I see that I'm about to reply to a non-Commodore newsgroup... oh! the shame... I hope non of my Commodore friends see me in that *other* group...

1869. Can anyone help me out? Please?

>Processor, Spreadsheet, Internet.. financial.. etc... I had all that on my
Atari..Should I go back... ... Ok, the modem was a bit slow..2400!

If you have space, use both. With JAM!!
you can connect both to one VGA monitor.
The world has moved past W3.1, although
there is obviously a lot of stuff that still can
be used. With APE and it's PC Mirror, moving files is much easier than a null
modem,
and using APE+ at 3X speed is awesome. I
have built my own PC's for quite a few years
(since maybe 1985). W95 and W98 seem
especially sensitive to driver problems, so my
next PC will be a system where someone
else has worked out the bugs. HP, Compaq?
In weak moments now and then, I think a
MAC would be nice, but then I come back
to reality realizing that MACs have such a
low market share.

Source record: 54984

Yeah, Tony got the wrong Russ there. I'm a newbie to this and I don't know anything about A8 sector addressing. Glad I could start an interesting discussion, however... :-)

For those who might have construed something more exotic, by "I wonder if hardware isn't easier" I meant building an SIO2PC cable vs. some software-only solution. I don't know how to modify drive electronics or mechanicals and I'm sorry if I implied otherwise.

IMHO (since Russ G. brought it up), I think XF551 was a very strange hardware ploy, particularly considering lessons learned from the 1050's "less, later, for more" marketing strategy. It's no wonder Atari couldn't survive! I always have this pathetic vision of a group of about 5 talented engineers being completely oppressed by a company more interested in stifling competition than growing business.

Amiga and ST were both worthy successors, but their companies didn't have the know-how or moxie to survive in a low-margin business climate and didn't want to learn.

Whew, I feel better now....

I often run programs here by pressing RAmiga-E and typing the name in.
It's certainly quicker than flaffing about with directories.

Unfortunately, on Win95 all your programs are hidden in some massively
deep directory structure containing spaces and it's a lot easier to
create shortcuts on the backdrop and run everything from there (which
is what I do). Okay, it clutters it up but it's either that or flaff
around with the horrible "Start" menu.

Chris

CHR$(147) = ATASCII chr$(125) (clear screen)
CHR$(18) = Turn reverse mode on (there's no Reverse key like the Atari's)

The POKEs force BASIC to use memory all the way up to $a000 (hence 0, 160).
This is the normal case -- I think John has just added it merely for the
sake of safety, since another program might have tinkered with the end of
BASIC memory pointer before this one is run.

Close, but not quite. If you ever happen to look *very closely* at a lone
artifacted pixel, you'll note that it actually spans multiple pixel triads.
Artifacting can't possibly be the result of precise color triad manipulation,
because then it would appear differently on TVs with different dot pitches.

The actual cause of color artifacting has to do with signal bandwidth and
other very technical things which I don't fully understand myself.

A bit of trivia: CTIA 400/800s artifacted in blue/green, GTIA 400/800s
artifacted in green/blue, and all XL/XEs artifact in red/blue.

Regarding C64 sprites, for what it's worth, doubling the width of a
single-color sprite so its pixels were equivalent to that of an Atari P/MG
would indeed make it 3 times wider.

Here's hoping DejaNews doesn't maul this post too... <g>

Lets not forget that millions of people got by on 486's with 3.1....

If it gets the job done, just stick with it. I have loads of stuff attached to my pc (girlfriend is a design major) and it works great. Windows really isn't that bad.

Ive also tinkered with linux, it's great fun. And with StarOffice available now, it's an even better choice. Linux NEVER crashed on me.

But it's more work to get your system configured correctly. I didn't mind messing with it for hours, I wanted to learn about unix.

That 486 is still functional, and quite powerful....just like your Atari. Don't get anything else until you need it. And if you got by with your Atari for so long, I suspect you don't.

eric

>and installed properly... one of the other folks here may know which chip it
>might be...

If we're talking about an 800xl then the chips to try swapping out ar the ones at positions U24 and U25 part # CD4051BE. I had a partial row of dead keys and I swapped those 2 chips around to determine if indeed those were the problem chips. Magically the bad keys moved on the keyboard as well.. :-) I replaced the defective one with a Motorola part # MC14051BCP and its working just fine.

Hi John,

If you have some experience with soldering material, you can build one.
For that, check my web page where I describe how to do that :

http://gauss.math.ucl.ac.be/~manu/Atari/monitor.html

Have fun!

captainrat@inficad.com (captain rat) said,

"i ported it to gw basic on my pc, mostly by inserting spaces. made me grateful
my atari basic used spaces, too. 'ready$' had me puzzled for a minute
there...those characters just print on the pc--did they do something special in
commodore basic?".

MS-DOS, GW basic, and Qbasic, use spaces as delimiters. The Commodore 64
does not. "Part 1 of demo" is a valid file name, and:

```
10 ifa<10thenifa>2then?"hello":goto90
```

is a valid program line. Variables names use either one or two characters;
additional characters in the name are ignored. Thus,

```
10 rf=50000:pokerface,20
```

will poke 20 into address 50000. And

```
10 t=8:closet
```

will close logical file number 8. There are many variations of that idea, too
humorous to mention. In the case of "ready$", it is the same as "read y$".
And "ready" is the same as "read y". They both use "data" statements to
define a variable (either y$ or y).

And thanks for reminding me to change that corny tag line of mine.

"John K. Picken" <yg473@victoria.tc.ca> said,

"> 10 poke55,0:poke56,160:clr:c$=chr$(147):r$=chr$(18)

Any BASIC programmer would have no trouble with the rest of the program
but would you care to enlighten us Atarians as to the effect generated by
the "pokes" and the 147 and 18 characters?".

I am not familiar with the planet "Atari", but welcome to Earth! I think
that you will find us to be a civilized race (if you ignore that stuff going on
in Washington, DC).

CHR$(18) makes subsequent characters sent to the screen, print in reverse
video. A carriage return, CHR$(13), cancles CHR$(18). CHR$(147) clears the
screen, and puts the cursor at the upper left corner of the screen.

The two pokes that you mentioned set the highest address for BASIC program
memory to 40959, the highest address permitted. Some BASIC programs set that
address to a lower number at the start of the program, to protect memory above
that address (where text, sound data, or graphics data, may be stored). If a
user then loads and tries to run a BASIC program that extends past that
address, he will get an "out of memory" error as soon as a variable is used.
So I got into the habit of starting my BASIC programs with those two pokes, as
a service to my fellow C-64 users. It tends to make them ignore the program
bugs. We Earthlings are a conniving bunch.

The following C program will do the trick (I'm assuming that you're able to
make the translation to your favourite programming language yourself):

```
#define leap_year(y) (y%4 == 0 && y%100 != 0 || y%400 == 0)

int mdays[] = { 0,31,59,90,120,151,181,212,243,273,304,334 };
int ldays[] = { 0,31,60,91,121,152,182,213,244,274,305,335 };

long
kDay(long date)
/* compute the difference in days between date (YYYYMMDD) and a fixed
reference date (1/1/1900)
*/
{
register long dif = 0; /* difference in days */
register long nr_of_ly; /* # of leap years */
register long year_dif; /* difference in years */
int yr = date / 10000,
mth = date % 10000 / 100,
day = date % 100;

year_dif = yr - 1900; /* difference in years */
nr_of_ly = (year_dif-1)/4 - (year_dif-1)/100 + (year_dif+299)/400;
dif += nr_of_ly*366 + (year_dif-nr_of_ly)*365;
dif += (leap_year(yr)) ? ldays[mth-1] : mdays[mth-1];
dif += day - 1;
return(dif);
}
```

To find the difference between two dates date_1 and date_2, use kDay(date_1)
- kDay(date_2)

good luck,

Tim Knigge

Source record: 54855

The following C code will do the trick (I'm assuming you're able to do the translation to your favourite language yourself):

```
static int mdays[] = { 0,31,59,90,120,151,181,212,243,273,304,334 };
static int ldays[] = { 0,31,60,91,121,152,182,213,244,274,305,335 };
#define leap_year(y) ((y%4 == 0 && y%100 != 0 || y%400 == 0) ? 1 : 0)

long
kDay(long date)
/* compute the difference in days between date (YYYYMMDD) and a fixed
reference date (1/1/1900)
*/
{
register long dif = 0; /* difference in days */
register long nr_of_ly; /* # of leap years */
register long year_dif; /* difference in years */
int yr = date / 10000,
mth = date % 10000 / 100,
day = date % 100;

year_dif = yr - 1900; /* difference in years */
nr_of_ly = (year_dif-1)/4 - (year_dif-1)/100 + (year_dif+299)/400;
dif += nr_of_ly*366 + (year_dif-nr_of_ly)*365;
dif += (leap_year(yr)) ? ldays[mth-1] : mdays[mth-1];
dif += day - 1;
return(dif);
}
```

The difference in days between two dates >= 1/1/1900 can now be established using:

```
kDay(date_1) - kDay(date_2)
```

1891. EDITORIAL on "Commodore 64" Re-release Possibilities

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-08 00:00:00 UTC
From: baronvr@my-dejanews.com
Message-ID: <79nmt3mrf1@nnrp1.dejanews.com>
Source record: 54857
Cross-posted to: rec.games.vectrex,comp.sys.atari.8bit

In the 2-99 Yahoo Internet Life and at www.commodore64.com there's a new c64 shown. It's like a cross between WebTV, a cheap 100mhz computer with 16MB RAM/3.5 floppy/modem/win3.1, and a c64. It's $250, but it begs the question: how much would just the c64 part have been? I'm guessing that a c64 with a built-in 5.25 floppy, modem, and (maybe) cheap HD, could have been done for under $100.

Is there a need? Would anyone care? What about a no-frills COMMODORE 64, an ATARI 8 bit computer or a VECTREX with a keyboard and language cart? Well...yes, yes, yes, and yes.

In the computer revolution, it's easy to forget those left behind. A huge number of households have computers, but a majority don't. $1,000 to $2000 for a normal setup just isn't in everybody's grasp. A $100 computer would have a huge market. Most of those less fortunate would have a chance to buy a computer. Who needs a Pentuim to type a letter, play a great game, or balance a checkbook anyhow? In a small way, those households might also have an advantage...

Most kids with computers don't program. With the old 8bit computers it was impossible to own one without picking up a little BASIC here and there and having the door open to higher languages. Within a week of getting my Atari 400 and 410 cassette drive (and a pack of the cheapest 90min Kmart Tapes for storage...some things have to be learned the hard way) I was CREATING my own programs. Today, kids brag about what programs they BOUGHT or the setup they BOUGHT. Back then, kids were more likely to brag about what they DID, or CREATED. And as low level as the language was, it instilled the ability to logically and reasonably work through a problem and later on, when someone was ready for higher level languages, they were easier to grasp. All in all, I think that the 8bit computer/consoles helped make better people.

Also, playing on a Vectrex or Atari will allow people to appreciate gameplay and originality before being wowed by flashy visuals.

A $100 computer? Sure. The sales numbers may start off small and even stay small, but if it's done at all it'll probably be done by small companies that wouldn't rely on huge numbers to make the whole thing worthwhile. The chips themselves probably would add less than a dollar to production costs, everything would depend on how cheap the parts and assembly would be. (hmmm...what about kits?)

Classic gamers would buy them, but probably not enough to warrant the whole effort (unless the company is geared towards small numbers). The key is that there's a new audience out there. Before kids discover N64s and Dreamcasts, before theyre put on a "one click away from everything" operating system, it

would be one last chance to show them how to do it for themselves. One more chance to show them pure gameplay, without hardware accelerated 3D. Besides, if I could play with my kids two-player MULE or Armor Attack, it would be very, very cool.

Thanks for indulging me. I feel better now.

This may be a valid argument for GeoWrite, but I never had a need for
fonts and such. About the only thing I need in that regard is the
occasional double-sized letters for emphasis and such. In comparing
GeoWrite to SpeedScript, I would say if you want "pretty", go for
GeoWrite. If you want good functionality, go with SpeedScript. I have
always preferred functionaliy over "pretty".

> : easier. With GeoPaint or GeoWrite or any other Geos-based software,

> That's the nature of a disk-based operating system.

That's understandable in a computer that doesn't have an operating
system and needs to load one in. The C64 doesn't have that defect. You
just load a proggy and run it. :-)

> Tandy/Radio Shack was definitely a model of human brilliance and
> fallibility in those days. Remember CoCo?

Oh, yeah. I remember wanting to try it out, but it was just too
expensive for me to handle. What I do remember of it though, was the
oddball interface slots it had. Now that I think about it, maybe it
wasn't so bad that it was too expensive.

> Liked VIM until I was assimilated. Resistance is futile.

Umm, what do you mean, "assimilated?" Does that mean you once had a
decent OS but had to sacrifice it for the sake of employment? I notice
your newsreader is Micro$haft Outhouse Expunged. ;-) Hey, things
aren't all that bad, though. In spite of your reduced capabilities,
there are ports of VIM available for a wide variety of OS's and
non-OS's like WinBloats.

As for me, I just can't live without VIM. I am constantly being amazed
by its capabliities, and I'm not even using a current version. And
when I use it as an offline newsreader, there are so many things that
I am able to do with it that I have never even heard of in another
newsreader.

But, I digress. I could go on and on.

Thanks to all for the replies re C64 BASIC.

I had pretty well guessed the c$ but the r$ was something I'd never seen.

The 18 character is somewhat interesting--I wrote a ml call for Atari BASIC years ago to do the same thing. I guess it's a toss up as to whether it's better to have a key or a function. Both would have been nice.

Where is the binaries group? I've been trying to find the Fuji for months. Really would like one of the animated, coloring changing ones or a 3-D rotating one. But anything will do.

> While both PCs and Macs can communicate with the Atari via a null-modem
> cable, only the PC (correct me if I goofed on this one, guys) can make
use
> of something like the SIO2PC interface.

This is a problem with an iMac though there is no standard serial interface
port. You have to buy an extra box to plug in to the USB ports. Costs
about 80 UK Pounds:(
The floppy drive I can easally live without but lack serial ports is just
too much for me:). BTW the SCSI port has also gone AWOL.

If you want a Mac go for a second user system. They may not be a fast as
the newer Macs but at least they have serial ports, SCSI and a floppy
drives supplied as standard. Cost a lot less too :)

ALSO
Why has no cable been made to connect to the SIO port on the Atari to the
Mac?

As far as I know the serial port on a mac is RS422 or RS485 semi-standard
which is (+/- 5 volt operation). The Mac serial port can be connected
directly to a RS232 serial port (on Pc's and modems) and in most cases
works fine.
As far as I can see a cable similar in construction to the SIO2PC/Ape could
be made with a logic buffer chip instead of the MAXIM part? Mind you then
some one would have to write some software for it ;)

1899. A question for you atarians

I posted this in
rec.games.video.atari
& was reffered to come to this group for this type of info
so here it is & thanks all of you
==========
I just picked up a Atari 65xe
w/ a 1050 disk drive & quite a few disks
to go with it....also incl. was the manuals for both
and these are both in the box too
the boxes are not in the best shape
but they arent falling apart either
& yes they do work...
well my question is
is this one better than the 400/800's?
ok a better way to phrase it is.....
in the atari line of them old computers where does this one stand...
I didnt see ant of these on auction anywhere so is it that rare?
or is it just that nasty of a piece of junk that no one wants it?
any info on this would be great basicly what is this thing worth to a
atari 8bit collector? if I put it on ebay what should i expect to get
for it?

thanks in advance
tim
please reply w/ a email & to the group
thanks

Can anyone verify DataQue is gone? They've probably been gone for years, but I have yet to hear of someone actually checking (and thus, they're still listed in the vendor FAQ).

Thanks,

-Michael

Source record: 54867

The 65XE was the lower end XE type machine. The XEs were somewhat less compatible with certain games than were the XLs, but that's not really a huge problem.

The 65XE had 64K of memory, it basically replaced the popular 800XL. The numbers on it are somewhat limited because of it being the "lesser" machine available, and the timing of its release, which was unfortunately not too long before the mid-80's videogame crash (and Atari has always, for better or worse, been associated with videogames). That said, it's not a huge rarity, no, although it might very well be the "rarest" Atari 8-bit that was in general release in the US (I suppose the 1200XL might vie for this, though...).

If someone were to advertise a RARE ATARI 65XE, my assumption would be that the dealer was a flea market type who didn't really know or care about the machine, and who was looking to get as much of money as he could, through whatever means possible. Personally, I don't like dealing with those people. Although the fact that you advertise yourself as accepting money for cracked software doesn't precisely give me a warm fuzzy feeling about your business practices, either...

In the box, with the manual and power supply, I'd guess you could eventually get a buyer if you advertised it in the $US40-$US50 range. Auctions can go either way, I wouldn't be surprised at anywhere from $US20-$US70 at auction.

The 1050 is the commonest Atari 8-bit disk drive, the "collectibility" comes with the manual and box. Probably around $US35 for the drive and power supply, the box and manual might add $10 if the right collector comes along.

>Is there a need? Would anyone care? What about a no-frills COMMODORE 64, an
>ATARI 8 bit computer or a VECTREX with a keyboard and language cart?
>Well...yes, yes, yes, and yes.

I use an old computer with a 80 Meg HD and 4 Mbytes of RAM for 6809 & 68HC11 coding... I also use it for my EPROM and C programmer, actually it is the only thing I can use to do these things... my other computer is just way too fast. I think there is always going to be a need for slower, cheaper computers... Plus, I don't feel bad tweaking things on a cheaper computer. Hardware things. Hooking things up to the ports that could be harmful, or anything else to that extent. Older computers are just fun to play with. I usually don't work on it, since all of the things I do require so much more processing power. We have been constantly updated with new applications and hardware that require bigger and better computers. We are brainwashed into using bigger and better. Well, not brainwashed, but rather forced to. It's the old timers, or hardware hackers, that get use out of the older slower machines...

Don't think many kids would want one... If you can't run AOL 4.0, forget it.

Sincerely,
Brett Walach

1903. 800XL Cartridge Detect Problem

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-08 00:00:00 UTC
From: 8-Bits <demita@sprynet.com>
Message-ID: <79oa0f$e9c$1@juliana.sprynet.com>
Source record: 54869

I have an 800xl that boots fine to BASIC Ready prompt, but does not detect
any game cartridges.

I have cleaned all connector contacts and did continuity checks on all connector and board traces. These appear to match another 800xl I am using.

Could there be a failing support chip that would not have an effect on the BASIC boot?

Are there any diagnostic routines available for the 800XL?

Thanks for any help - John

Heheheh.... I was actually going to 'recreate' a ' pc' Commie 64 w/ some spare parts and a TV-Out video card.... I wanted the unit to be small & compact like the original C64, along with a built in 3.5" floppy. I had all of the stuff, but I couldn't locate my old 386 slimline, of which I was going to use the mini power supply and the L-Shaped ISA adaptor so the cards could lay on their side... I could make my own adaptors, but I would still need a mini power supply... I figured I'd just run a C64 emulator on it. I even have a half-hacked 1541 drive laying around that's only a few steps away from being interfaced to a pc parallel port. Oooh... and I have loads of old floppies! :) The 'Commodore 64 Web.It' is what inspired me to do this in the first place. I e-mailed the company before they publicly announced the price. When I received the estimate, I figured I could do it better myself. The C64 compatibility is really just a gimmick (Unfortunately).. It should've had a 1541 interface.

Message-ID: <zNNv2.7066$YP1.11533829@newse3.tampabay.rr.com>
Source record: 54881

I bought what appeared to be "New In Box" CX42 Wireless Joysticks, with factory twist-ties, etc (even price sticker showing KayBees toys as source). These appeared to have "zero-usage", but when I installed the requisite two alkaline 9-volt batteries, the performance of these babies ranges from erratic to nonexistant control while playing games on the 2600. The "TV transceiver" portion of the product appeared equally "mint" in condition, so the crummy performance of this product is baffling to me. I am only about 6 feet away when I try to use these controllers, and I have read that these Atari units were supposed to have been very good as wireless controllers go. What -- if anything -- can I do to make these controllers behave more accurately?

>1: is it used for serial I/O?

Theres an OUTclock while the atari is sending (commandframe and data). It can be used in peripheral. (The HDI Interface (by Erhard Pï¿½tz - see ABBUC) use this outclock to detect the actual speed rate without fail-access while toggling to ultraspeed)

>2: If so, after a command frame, does it continue to allow the

The outclock is only available while the atari sends a bit/byte. It stopps after the command frame.

>peripheral to communicate back to the computer? or does the peripheral
>generate it's own reply clock?(unlikely).

No, theres no way. The POKEY can be programmed to shift in with an INclock (i think so) but the operating system programs the POKEY to shift in asyncron with 19200 Baud (some speeders switch to higher baudrates). The inclock isnt used for reading serial bytes.

bye, MacFalkner.

>some new ATARI cartridge games.Are there any problems ? I think Millipede is
>8K
>, Ballblazer 32K and the new EPROMs shouldnï¿½t be larger.

I have build an Flash-ROM upgrade to install up to 512KB OS ROM and 512KB BASIC (CARTRIDGE) ROM. The prototype runs perfectly. With this upgrade you can burn/test your own cartridges in your atari, also several OS-ROMs (OS modifications), later you can burn the data in a real cartridge if you want.

Look at http://members.aol.com/MacFalkner
'AFLOS - Atari-FLash-OS'

Today i have the problem that i can only simulate 8K cartridges (like BASIC), but i will also simulate bankswitched modules like MAC65 etc therefore its 'only prototype' this time.

Daniel Morrow <videoman@cdsnet.net> writes:

>Doesn't the reverse on and reverse off keys on the c64 keyboard qualify as
>being like the reverse key on the atari's?

Functionally, yes (if you press CTRL-9, Atari people, your text on a 64 will start appearing in reverse). But this isn't the same as the Atari's Reverse key. You can actually do this on an Atari:

10 print"[press the reverse key]hello[press the reverse key]"

And when you LIST and RUN this, you'll see the reverse letters. hello will be reversed. You're not inserting any control characters -- you've actually entered HELLO in reverse video.

On the 64, you'd have to defeat quote mode for this trick (else you'd insert the Reverse character code, which ruins the whole game). But it won't work the same way. Try this:

10 print""[press INST/DEL to erase that last quote][CTRL-9]hello[CTRL-0]"

Looks good, right? List it, still looks good, right? Run it. It changes the text colour to white and prints nothing else. The reason is because it sees the H as a CHR$(8), the E as a CHR$(5) (the code for white), etc. -- all as control codes. Thus, the Atari Reverse key and RVSON on the 64 don't work the same way.

I don't know who to ask so I'm posting this for my fellow atarians.
Recently I came to acquire a wang minicomputer(?) from an insurance agency.
The computer itself measures 15"x15"x22" and has several large cards
accessible from the back. Two of them are labeled channel 1-4 and have four
db25 plugs each. I also have the disk and hard drive thing which is about
half the size, with a 5.25" floppy, two hard drives, and two more empty
racks inside. I have two terminals w/monitors and a tape backup unit as
well. So what can I do with this thing?

Thanks,

Patrick Robbins

Atari sprites can be set to different widths. This gives rectangular
pixels but has its uses.

Its a much later model. It has more memory, a few graphics frills and is
quite a nice machine. The 130XE has more RAM (128K versus 64K). I
certainly wouldn't argue if I got offered one at a reasonable price.

It's possible, although...
What type(s) of machinery/devices would cause such interference? I am attempting to use these with a "projection" type TV. I am in a residential area, with no "new construction" in the immediate area. Our radio (both am and fm) reception is fine.
I know it's not the "same", but our wireless telephones all work fine; also, TV remote controllers (including a "video sender" that transmits cable to a receiver in another room without cable) all work fine. Note: the above items are not in use when I use the Atari wireless joysticks. Any further thoughts/remedies? Anyone?

Unfortunately, you're right. On the other hand, for kids with nothing but a Gameboy there might be some hope. If all I was suggesting amounted to a "disposable" computer to be replaced by an expensive one after a year, that wouldn't be so bad (my current computer depreciates at about $100 a month). The kid'll make a few simple games, play some classic ones, then abondon the thing so his dad doesn't have to share it.

I'm not only thinking about them. The subtext of my post is that I want some inexpensive but brand new gear for myself. I didn't take advantage when Vectrexes were originally sold at clearance for $50 each...I want another chance!

The Yahoo article made it sound like a c64 re-release. On the bright side,
it's going to come preloaded with a software library. A c64 and a built in
1541 would have been much cheaper and more useful, but, it's a start.

Please, don't get me started *again* on WinBloats. If I can't access
the CLI straight on, I don't want anything to do with it. I've grown
quite accustomed to just typing in a command and the computer executes
the appropriate response. As far as using a menu is concerned, I write
my own. That way, I know what to expect. I don't get any rude
surprises, and the computer doesn't lock up on me for some
unexplicable, irrational reason.

I did at one time use WinBloats. Then one day, without warning, it
locked up my computer. I had to turn it off to reboot. When I did
reboot, my harddrive was trashed, and no operating system. Of course,
once I fdisked and reformatted the drive, I restored everything from
backups. Then I deleted everything that had anything to do with
WinBloats. I haven't used it since, and I don't intend to.

Yeah, I do all my editing with VIM and insert control sequences through out my
text like .ul, .lq, .ds etc. Then I run macros which search and replace these
with the actual printer escape sequences. I've pretty much got all the
functions I used most in BBWriter implemented in VIM macros, also alternate
pagination before printing. :)

Rephrase that to "Using only one eye [and holding perfectly still], you have NO real depth perception." With one eye closed, and while walking around (especially sideways), I can adequately judge the depth location of surrounding objects. It's just that with 2 eyes you can do that from 1 physical location, using your 2 built-in vantage points.

Another approach, for sure! Tom Hunt was working on a proxy server using Windows 95 that had some promise. I also have text access to the Internet through my library's system (no attachments or downloads, however) and I use the Atari straight with Ice-T for that -- at 2400 baud!

What do you run on the Linux end -- femul?

>I think....

Using only one eye, you have NO real depth perception. Yes, there are
visual "clues" which hint at depth of things but it aint real. The
difference between using one eye as compared to two is the same as
viewing a common picture, or using a stereoscopic viewer with the
proper set of two pictures. I really don't know why some people
reject valid scientific explanation. If you do not trust science then
at least trust the market. If one eye alone could do it all we would
have is telescopes and no binoculars. We would only have computer
monitors and no one would make LCD shutter glasses, we would not be
able to use triangulation when using survey equipment from different
positions.

As to your eyes... they are sensor equipment hooked up to your
computing device (brain). A brain is able to compute depth based on
sensory input from two eyes using triangulation just like a surveyor
can calculate depth or distance siting a spot from to different
vantage points. With only one eye, we can make guesses about distance
based upon an assumed size of something and how large it looks, and
also by something being obscured by something else. If you have a
sphere in the sky of unknown size with one eye you cannot tell
distance because of the size and distance relationship. With two
eyes, so long as the spere is not so far away as to make the angle to

the eyes so acutely small that our brain is unable to compute, you are able to gauge how far away it is, and then thusly also its size.

Obviously, this gentleman possesses a well-equipped Wang. Although the Wang Floppy is only 5.25", it is stated to possess a double hard drive, such that when put to the tape (after the Floppy is backed-up, of course), is no less than 22" long, with a girth of 15" on both other sides! And he is such a Card, that his Wang is capable of channeling up to Four, with 25 Plugs each! It is even stated that "Monitor" Lewinsky may be interested in this particular Wang!

The only way I think this would fly is if it would be about $75, and come loaded with more games then you could shake a stick at.. otherwise people would head for a playstation, or a n-64 for games...

let's face it, the 64 and the atari has really been forgotten by alot of people, and unless it's a big value added thing, technology prices have dropped too far to make a expensive version of these fly...

I REALLY don't think they'd sell unless they were around $50, but was kind with the $75 price tag...

SDX is 64k consisting of two 8k banks of code and six 8k banks of ROMdisk. Action! and MAC/65 each consist of one 4k bank of common code and three selectable 4k banks of code. BASIC-XE appears to be one 4k bank of common code and two 4k selectable banks of code with an additional option to use the RAM under the cartridge. i.e. the common OSS carts are a maximum of 16k total though they could be made larger.

The part of my statement you didn't pick up on was that Atari cartridges do not bank switch. That is why they are limited to 16k i.e. the address space from $8000-$BFFF.

You can get Internet-ready computers in the trash, these days. A 486-33
system with Windows 3.1 and a few old programs makes a perfectly decent
machine for e-mail, netnews, and Web browsing.

Any idea what OS it is? Does it boot up? Most systems like this just come with the basic OS and software they were designed to run i.e. an insurance package. Beyond that you're stuck. If you're lucky, it may be a Unix variant in which case it ought to have compilers and text tools on it. If not, they should be fairly easy to source from somewhere on the net.

Reality begins to set in for me...but...$60, I think would fly. The graphics aren't much less sophisticated than a Gameboy which sells for around there. You lose portability, but you gain a computer with a language...big gain. It's just because of that technology price drop that I think the thing could be made for $50-60. The only thing that would cost more is a new Vectrex, because it requires a special vector screen and an analog 4-button controller.

I'm really reaching here...

Could if you wanted to. But the language carts use the $A000-$BFFF region so you have an extra 8k of ram for program space. That is why they have the slightly unusual bank switching at $B000-$BFFF.

There really is no limit in how big of a cart rom you could use. ROMs are static, so if you wanted to you could even mount a mechanical switches on top of a cart to select banks. Much more elegant solution to use latches under software control though.

But if you're used to using your eyes, then you will intuitively know the
distance that your lens is focussing on. It's a barely noticeable part of
perception, and vastly underrated. It is _the_ best part of estimation
after the obvious binocular thing. (And binoculars are popular because
it's uncomfortable staring down a tube with one eye squeexing the other
shut. It is not a matter of estimating distance - the lenses in the
binoculars really throw _that_ off....

My experience has been that people who refuse to make a simple list of what they have and how much they want for it (particularly when in response to a message that was already pretty precise) will, at best, be just as lazy when it comes to packaging, sending, and doing any necessary followup to the deal, and at worst, are looking to rip people off.

Caveat Emptor.

1965. Pin-outs for 1200xl LSI chips

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-10 00:00:00 UTC
From: bmw3@cec.wustl.edu
Message-ID: <79sld6$1ct$1@nnrp1.dejanews.com>
Source record: 54925

Is there any central website where I could find pin-out diagrams for the LSI packages in the Atari 1200xl? Specifically, I'm looking for pin-outs for the CPU, ANTIC, GTIA, POKEY, memory decoder chip, and possible even the two OS ROM's. And before you ask, I did check the Atari 8-bit faq, which only had pin-outs for the external ports.

Thanks.
Ben West

1966. Trade for 8-bit stuff

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-10 00:00:00 UTC
From: Anthony Rudzki <tony@embeddedmicro.com>
Message-ID: <36C1D2F4.48EF3033@embeddedmicro.com>
Source record: 54926

Does anyone have a LOT of 8-bit stuff with:

at least, a 130XE and XF551 drive,

that would like to trade for a Mega STE?

I may be wanting to get rid of mine, but would like to get some 8-bit stuff instead. Lance at video 61 got my Mega ST and the 8-bit stuff I got in return REALLY got me hooked again!!

Thanks,

Tony

Private e-mail at: ARudzki@sgi.net

1967. Possible new I/O Box

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-10 00:00:00 UTC
From: Anthony Rudzki <tony@embeddedmicro.com>
Message-ID: <36C1D515.DB9544FB@embeddedmicro.com>
Source record: 54927

I am in the design phases of a new expansion accessory for the 8-bits
and I am wondering if there is an interest:

SIO connection to allow EVERYONE to use it,
2 serial ports >9600 baud
1 Parallel port
Floppy connector
Possibly IDE hard drive connection

Think its a good idea? e-mail me at: ARudzki@sgi.net

2 background questions:
1-Is "speeded up" I/O a matter of setting pokey up with registers? or
does the 8-bit have to do all the work

2-I believe there is an interrupt line on the SIO port entering the
8-bit. Is this vector usable to have a peripheral get the 8-bits
attention?

Suggestions are welcome, too.

Thanks. Tony

1968. Frogger on the PC (Hasbro)

Newsgroup: comp.sys.atari.8bit

Be ready for some torture. When I ran on a Wang (back in
70-73 in the USNavy) it was a pretty hot computer. You
could buy the programmable desktop calculator as it was
sold back then - with harddisk, etc. It did have an
assembler. Sorry, no higher level languages back then
but the assembler was pretty well designed with macro
capabilities and subroutine calls. I did the programming
for the Navy to check that items being purchased under
contract met the tests as specified in the contract
(statistical programming.) Ran everything from planes,
to torpedoes, to fire fighting equipment - you name it
and we tested it.

It kept me out of Nam, was a fantastic first job, and
taught me more about computers than I had learned in
my first two years of CS at Southern Illinois University.

If you do take to programming the beast, you will have
to be meticulous. Actually it sounds like you have a
later model than I programmed on since its called a
minicomputer. Maybe higher level languages even
became available for it.

With our older model we ran everything from simple
statistical chi squares to regression analyses. It
was quite capable and produced great results for us.
Served a team of 90 officers who were testing the
equipment. Yea for OPTEVFOR! Thus started my computer
career.

Cheers, Wayne

1978. Designing a 'NEW' home computer

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-11 00:00:00 UTC
From: puputai@aol.com
Message-ID: <19990210200231.13902.00000191@ng-fc1.aol.com>
Source record: 54794

I've often thought about the possibilities for
a new computer line, designed along the
lines of the older atari's and commodores.
I myself miss the days of messing around
on my 800xl.

Before the atari my Dad bought
an Ohio Scientific Challenger 1P, which
we built a hard drive interface for, added memory, joysticks, and I hooked up a
terminal
for a decent screen. I also owned a couple
of Hitachi peach mb-6890 computers which
were really interesting 6809 beasts, Imagine
an IBM-pc made lots better, with a 6809 cpu
driving it. I programmed these lots too.

I then bought a second hand atari-800xl. Anybody even remotely into graphics
back
in the 80's _HAD_ to try out an atari 8 bitter.
I loved the machine, its Display List, graphics
modes, sound, a fastish 1.79 mhz 6502, player
missile graphics...

My next machines were embedded cpu's and
Silicon Graphics/Suns/PC's Unix boxes,
Netware etc...

Somehow the current PC just doesnt have the
same kind of appeal...

I've been thinking quite a bit lately about
the chances for a startup to design a new
inexpensive entry level computer. NOT IBM-PC compatible.

I was thinking about something
with say a strong-arm CPU, and a fast
DSP chip generating the video [Does anybody remember the TV-Typewriter
type stuff, and a book back in the late 70's
which had details on using the CPU to generate the video signals....].

Anyway I've done a few cost calculations
and had a few idea's and figure it would be
doable to build something for say $200 which
was expandable and _fun_ to use.
Ideally I'd like a machine with
a core OS in ROM, and some Flash memory

(flash cards ???bit pricey but I like the idea
of no moving parts)...
totally solid state usable with no HDD. Ethernet
or something similar for connectivity...USB ??
You could have a built in modem, and download a new OS from the internet if you
wanted... [flash memory for OS???]

The OS and all software /hardware sold would
be totally open... Is this an insane idea ???

Imagine a large lunchbox, with a bunch
of ports on it [VGA connector, composite
video out, serial, ide, centronics, joystick
ports (programmable for IO like the old atari]
and a PS/2 keyboard/mouse connector.

You plug a $4 PS/2 keyboard and $4 PS/2
mouse in, hook up either your existing SVGA
monitor or composite video, and turn it on...

This machine _wouldnt_ be faster than
a current PC, but it would be a nice intergrated
box... You could expand it much like the
old atari 8'bitters. Hook up an IDE drive,
a floppy, a cd-rom drive, whatever you want.
But you dont have to buy then at the outset.

Other idea's were recently inspired by the
purchase of a $35 brand new sega genesis.
The C-compiler is available, and its got a
68000 in it and some graphics hardware...
I've wondered if there would be a market
for a super cartridge with a minimal 68000 OS,
PS/2 keyboard connector and C compiler/
editor built in..., some way to transfer files
to/from a host computer...

Just my pondering...
Responses welcome...

Atari makes a 48k module that you can install... swap out the old board, in with the new.. and add 4 jumper wires.... There are ways to modify the 16k board... however, since the board goes for about $20, may be easier to buy one... get in touch with Best Electronics or hmmm.. B and C (?) ...

The Atari 400 was upgraded with a custom memory board. It also required
soldering 4 points on the bottom of the main board. I have heard of plans
to upgrad an Atari 16k board to 256k or so, but know nothing of it. The
best bet for upgrading the Atari 400 memory is to find an old board and to
install it.....or grab a 32k board and swap it.

I still have my original Atari 400 with 48k and I added a B-key keyboard
to it. The only thing I have to do is add the mod for monitor output and
it will be as capable as the 800......I have an 800, but I think I am
going to set up my 400 unit instead, with a couple of 810's, and an 850
with an 410 as well.....finally, my dream Atari setup I could not afford
back in 1983! :-)

1) You can speed up the serial port by setting pokey registers, but the
standard OS doesnt support this, you need additional driver software

2) An interrupt on the SIO INT line jumps into vector $204 (if i remember
right).
This vector isnt used by the standard os (links to a dummy return), you must
start your own software at this point.

1982. 1040ST, 520ST ???

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-11 00:00:00 UTC
From: Bret Kellihan <bkellihan@earthlink.net>
Message-ID: <79u13iimj1@murdoch.acc.Virginia.EDU>
Source record: 54798

I was given a box two years ago with both of these in the box, several monitor (B&W, and color), several boxes of single sided disks... (all sorts of programs), and external hard drive... (20 meg?) and a bunch of documentation.

I played with the stuff for a few days. Now it's sitting in a room in my house. The 520 never would work, but the 1040 works fine.

Are these worth anything? What level of computers were they? (ie High end? Low end?) I'm asking because the only Atari I've ever owned (on used) was an old 400....

thanks,
bret

1983. Re: Pin-outs for 1200xl LSI chips

Newsgroup: comp.sys.atari.8bit

From: Olav Queseth <olav.queseth@radio.kth.se>
Message-ID: <36C2A0C0.35136BF@radio.kth.se>
Source record: 54799

Hello!

Some of the pinouts are available at:

http://www.xmission.com/~trevin/atari/

One of the roms is a standard 27128 chip. The pinout can be found at

http://www.ece.orst.edu/cgi-bin/cgiwrap/~paul/pinouts/datasheet.cgi?27128

The other rom (basic) is a strange 8K rom in a 24 bit package. The
pinout is
similar to a 2732 except:

Pin 18 is A12 and pin 20 is Chip enable. (or was it the other way
around).

The pinout for 2732 can be found at:

http://www.ece.orst.edu/cgi-bin/cgiwrap/~paul/pinouts/datasheet.cgi?2732

I hope this info helps you. (I have an 600XL so things may be different
on a 1200XL). If you find the info on the memory decoder chip let
me know.

Sincerely
Olav

The 520 and 1040 were 16bit machines designed and sold as Mac killers. In
Europe and particularly the UK/Germany they did very well. The 1040 was
the first machine with 1Mb of RAM to sell for under $1000. They're a bit
crap now but in their day were fine machines that generally outperformed
both Mac and PC equivelents at half the price.

I can name seven people on this new group who have offered me money and told me they would buy specific items at specific prices. Some of them still have posts on this news group today. Three of them told me they had mailed checks. I have received nothing from them.

When it comes to Atari stuff, it is the seller who is stuck. This is a buyers market, no doubt about it. So I will keep my Atari stuff. But when people say they want to buy something, well, I am skeptical.

My experience with them is fairly good. The only thin I didn't like was
that they ate batteries like crazy. Other than that, they seemed to work
fairly well to about 20' from the base. Not too bad in my opinion.

Bowling,
Just be sure to have very fresh/stong 9V batteries when you use them.
They tend to do wacky things with weak ones.

First.. how do you plan on adding a video output to the 400??? I've got a 400, with 48k board, and Bkey....I have only one article on how to add video, and it isn't easy for a novice as myself.....are there various plans...

Pleae let me know... also, what have yougot regarding memory.. it can go higher than 48k.. and Axlon bank select... any info here????
B'rgds,
Vinnie

1990. Re: Atari CX42 Wireless Joysticks

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-11 00:00:00 UTC
From: Bowling <mbowlin1@tampabay.rr.com>
Message-ID: <5%Aw2.597$h5.3295@newse2.tampabay.rr.com>
Source record: 54806

The 9-volt alkaline batteries that I used were brand new, never used, fresh from a blister pack. What's more, I checked their "strength" with a battery meter, and they were very highly charged.
I REALLY wish these Wireless joysticks would work satisfactorily; they seem like such a neat product. Anyone have any additional ideas as to what might help? Is there, perhaps, some sort of "signal magnifier" that could be attached to the Transmitter unit on the TV? Or a receptor "magnifier" that could fit onto the antennae that are on each of the controllers? (sorta like the "magnifier" antenna attachments that you can buy for a cell phone's antenna)?
Or, is there something that might need to be "cleaned" inside the joystick units themselves? These units are brand spankin' new, so there's gotta be SOMETHING that will restore them to acceptability (I hope!)

>with an 410 as well.....finally, my dream Atari setup I could not afford
>back in 1983! :-)
>
>Willy
>

B-key Keyboard? Is there a way to get past the membrane keyboard? I assume its possible (I'm an engineering student)... I just never thought there was an easy way to do it. What's involved in the upgrade?

The reason I've asked is because I'm trying to reassemble my Atari 400 system. I sold all of it 10 years ago... <sigh> When I bought it, it was a 48K. The only thing I've found to be reasonably priced and guaranteed working condition (as opposed to untested) was a 16K system, so I've ordered it, but I would really like to have that extra 32K of ram.

(Thanks Vinnie and Curt... I contacted best. I haven't found the exact part, but I sent them a message)

Another nice thing to be rid of would be the membrane keyboard... So what is the B-key keyboard? ;-)

thanks again,
bret

1992. 32 in 1 for trade

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-11 00:00:00 UTC

I have a mint condition copy of 32 in 1 for trade, I know this is mildry
rare, so I'm not expecting Chase the Chuckwagon or anthying, but I would
like something nice.

Im especially looking for an NTSC Xenophobe or a NTSC Roadrunner, but
I'll entertain other offers, just ask!

Tempest

I have a list of games I own at

http://pilot.msu.edu/user/reicher6/2600.txt

I'm looking for anything not on that list.

Source record: 54810

Actually the MARIE can do 320 X 216 maximum if I recall correctly. I doubt they'll still have it, but you can give it a shot, try contacting General Computer Corporation, they are still around and they are ones who designed the MARIE chip for Atari, who knows... someone might still have a file with the low-level specs and details of the chip.

>
> The OS and all software /hardware sold would
> be totally open... Is this an insane idea ???
>

Not at all ... but in my opinion the concept will fail as long as you don't have
BIG partner companies behind you.
Look at a stock AMIGA 1200 today ... ok, it is not fast, but it's expandable and
for a start it is sold for around 500 DM today. It's fun to use and if you want,
you could spend a lot of money do expand it to almost every level you want it to
reach ...
But ... few people know ... and few people do ... because it's not IBM compatible
... and it's ooold (early 90's design)! With a HD, a 68030 and some extra RAM it
runs all kinds of professionell software incl. up to date word proc's, spreadsheets

and stuff at a reasonable speed ...
Sure, the "big name" games are ported with a serious time delay (e.g. Myst, Quake, Z) ... and sometimes even by "hobby" teams taking an "open" source code and doing the job (e.g. Doom, Descent, Heretic, Hexen). And then, 3D games are no fun on a 68030 ... 68060 and/or PPC are expensive ... enough of that!
It's simply no choice to the public!

In my opinion, a cheap stock system with good expansion capabilities will find a ready market as long as it's easy to use, runs well-known office software and has a "power" company behind it which is able to provide finances to get the thing promoted ... with games, games, games ... well-known games, of course ...

In the gaming sector, Sony's Playstation is the prove that there is always a chance for something new, if it's good and if the promotion works!

Why shouldn't it work with a new computer design? The iMac kind of works, although it isn't THAT cheap ...
The Web.it doesn't work at all, although it IS kind of cheap ... but I'm not so sure that it's really good ... perhaps because it's IBM compatible?

Thanks for reading such a long text! Bye!

Tobias

Ahhh .. the B-key 400! That was an exact replacement for the membrane keyboard! It was basically 'chicklet' sized keys, where the swithces and key caps were mounted on the top side of a board that was about the same size and thickness as the original membrane board. I'd say they were along the lines of some of the laptops out there today... go to (or shoud I say Goto !) Curts website and take a look around.. he's got one picutred there.. find the Atari Historical Society at : www.atari-history.com'.....

I had one of those. Since I had used the membrane for so long, the "B-key" seemed great. But then I got an 800 and found out how lousy the B-key was too. Yes, the B-key is better than the membrane (much easier to use a smart bomb in Defender), but that's about all you can say about it.

I wouldn't use flash - limited number of write-cycles. Write to it so many times, and it'll die just because it's exceeded the number of write cycles it can handle.

>Built in Modem not necessary.. should be connectable per USB.
>
Whoa, hold your horses on USB here. On a system like this, having everything under USB would be a Very Bad Thing(tm). You think you've got a bad rat's nest NOW, wait till everything's hooked up with USB! One long noodle... I'd go with standard connectors for as much as possible. You'd already be churning out the strangest computer anybody's seen in recent computing memory, no need to limit yourself by overusing USB.

I have two copies of Wizard and the Princess for sale for the Atari 8 bit.
The first still has it's original seal intact. The second copy has a broken
seal about 3/4 of the way along (probably due to ageing), but it can be seen
that the guides etc. inside could not have been removed as the gap in the
seal is not wide enough.

Please email offers to rsmith@planeteer.com

Thanks,

Richard.

Sounds to me like a bad disk. Try a different boot disk--essentially any DOS and terminal program will get you started to the point where you can download the DOS you want (MYDOS or Sparta are the only ones worth considering).

I have 10 different AH games for sale these are
all cassette games and are all in excellent shape
(Brand new in shrink-wrap).

First come first serve. This is not an auction.
However if you want them you must
1. pay with a money order and
2. pay for shipping.

Easy enough...

Here's the goods, at very good prices:

Voyager I (Sabotage of the Robot Ship)
Works on TRS-80, Apple II, Atari400/800 and PET CBM $6

Arcade Pak #1 (Shootout at the OK Galaxy)
Atari 400, C-64, Vic-20, TRS-80 $6

Arcade Pak #2 (Five Card Draw Poker)
Works on Atari400/800, Apple II+, PET, TRS-80 $6

Arcade Pak #5 (Tank Arkade)
Works on Atari 400/800, Vic-20, CBM PET, Trs-80 $6

VC (NAM War Sim)
Works on Atari 400/800, TRS-80 $6

Computer Stocks & Bonds
Works on Atari 400/800, Apple II, PET, TRS-80 $6

Guns of Fort Defiance (1812 war sim)
Works on AtarI 800, TRS-80, PET, Apple II $6

Planet Miners
Works on Atari 400/800, Apple II, PET, TRS-80 $6

Knockout (Sports Illustrated)
Works on Atari 400/800 $6

Always save the best for last....

Tanktics (Computer Game of Armored Combat on the
Eastern Front). This is a very large game comes with...
Two-Piece full color 22"X16"mapboard
Over 240 1/2" counters
5 different scenarios
Instruction booklet

Cassette
(Remember it's shrink-wrapped)
Works on Atari 400/800, Apple II, PET, TRS-80 Only $10 :)

Get em' all for $60.

Good Luck,
Smitty

In article <19990210200231.13902.00000191@ng-fc1.aol.com>,
puputai@aol.com says...

> I was thinking about something
> with say a strong-arm CPU, and a fast
> DSP chip generating the video [Does anybody remember the TV-Typewriter
> type stuff, and a book back in the late 70's
> which had details on using the CPU to generate the video signals....].

Strong ARM would be nice.
What it should also have is a Basic Prompt at startup.. maybe a good
common basic dialect, like a mixture of them all.

Full screen Editor like on C64.
Up and downscrolling in Basiclistings, like some C64-Basic-Enhancements
give ya.

Graphical BASIC-instructions, like PLOT, SYMBOL, MOVE, DRAW, CIRLCE,
LOCATE.. just like an Amstrad and C128 have.

Sofware delivered in ROM should be a C-compiler/linker, A good Texteditor
and an Assembler tool.

Different GFX-Modes for different purposes:

Hires Bitmap with 8*8 bit, 8*16bit and 8*32bit cards, 2 colors.
4 bit per pixel, 16 Color Bitmaps. Palette based.
1 byte per pixel, 256 Color Bitmaps. Palette Based.
3 Byte per pixel, RGB-Bitmap.

1 common memory area (256x3 bytes) for a palette.
Palette entry 1 is always the background color for pictures, palette
entry 0 is always the transparency color.

Sprites:

256 Sprites visible the same time without any tricks.
Sprite-system:

1 (32bit-)Adress for memory-position of your sprite-pointers in a common
I/O-control area.

1 byte adress for lenght of sprite-pointer-table

sprite-pointer table setup:

Sprite 1 memory pos.,Sprite 1 X size in pixel (16bit), Sprite 1 Y size in
pixel (16bit), Sprite 1 X-Position (16bit), Sprite 1 Y-Position(16bit),

Sprite 2 memory pos.,Sprite 2 X size in pixel (16bit), Sprite 2 Y size in pixel (16bit), Sprite 2 X-Position (16bit), Sprite 2 Y-Position(16bit).....

Sprites have 1 mode only:
1 byte per pixel, 256 colors (from palette).

I have defined 16 bit as Sprite X/Y size, because that makes it possible to create even 65536 x 65536 pixel sprites.. that would make it possible to create whole game Levels with 4 layers using 4 very large sprites :).. each layer could be moved independently by simply modifying 4 bytes per layer!

Lots of FINE details... :))
We'd need a good soundchip too.. maybe Hardware MP3-decoding, MID/MODPLAY and chiptune.
The system could be fairly simple:
Load MP3, give start and endadress to Soundchip I/O, give type of data (MOD/MP3/Mid) and set "Init" and "GO!" bit... whahooo!! And the sound blasts off..

Oh yeah.. and at least a 32 bit liniar adress bus to access up to 4096 Megabytes directly :)

Oh, yeah.. and a MMU that makes each program run at $00-$xxxxxxxx.

Of course we need a register that tells the vertical and horizontal raster-position on the fly, so you could "theoretically" set a dot by waiting for a certain x/y position and modifying the background color. This should be inplemented, because then you are able to split graphics-modes and stuff on every spot on the screen if you want to.

> totally solid state usable with no HDD. Ethernet
> or something similar for connectivity...USB ??

USB.
HD should be built in as Standard, but the system must run properly, even when the HD crashes completely.
I'd prefer a usual 8 GB HD.. they'll become even cheaper.

There is no need for a built-in standard disc drive, but maybe the system should be sold together with an USB-zipdrive.

> You could have a built in modem, and download a new OS from the internet if you
> wanted... [flash memory for OS???]

I'd prefer Flash Memory, yeah.
Built in Modem not necessary.. should be connectable per USB.

> The OS and all software /hardware sold would
> be totally open... Is this an insane idea ???

Yeah, deliver all the diagrams with the Machine..

> Imagine a large lunchbox, with a bunch
> of ports on it [VGA connector, composite
> video out, serial, ide, centronics, joystick
> ports (programmable for IO like the old atari]
> and a PS/2 keyboard/mouse connector.

Not really.
The GFX-Card should be "built in", but expandable with an extra 3d
Graphics unit for high end GFX.

Drop PS/2 Mouse/Keyboard.. let's stick to USB.. no cable salad.
Video out is cool.
Programmable Joystickports are cool. They need a D/A-converter too, to
allow analogue and force-feedback joysticks too (besides the digital
pads/Sticks).
Should be 4 Joyports!

> You plug a $4 PS/2 keyboard and $4 PS/2
> mouse in, hook up either your existing SVGA
> monitor or composite video, and turn it on...

yeah. SVGA-Connector for your monitor is a must.
But I'd drop that ps/2 thingie.. USB is future.

> This machine _wouldnt_ be faster than
> a current PC, but it would be a nice intergrated
> box... You could expand it much like the
> old atari 8'bitters. Hook up an IDE drive,
> a floppy, a cd-rom drive, whatever you want.

> 68000 in it and some graphics hardware...
> I've wondered if there would be a market
> for a super cartridge with a minimal 68000 OS,
> PS/2 keyboard connector and C compiler/
> editor built in..., some way to transfer files
> to/from a host computer...

C-Compiler should be a standard tool in the OS, as a good ML-Monitor
should be integrated in the OS.
Load Adresses should be shown when loading too.

> Just my pondering...
> Responses welcome...

Machine welcome.

Source record: 54822

It sounds like it could be a Wang VS....

Warning::: This is all from ancient memory...

VS's were quite nice mini's built a few years ago, and an IBM System-360 type architecture... 16 32 bit registers if I recall correctly.... The wang I chiefly looked at was a VS-65. It had an interesting OS with the mainframe style frontend.... Definately not a CLI type interface... If it is a VS, it may be possible to track down some software for it... I think we had a fortran and cobol compiler and some other stuff, word processing/database type software. When looking at it I did notice it had floating point hardware and the technical specs said '4 MFLOPS'... 4 64 bit floating point registers pops to mind.

The terminals were well designed with decent screens and good keyboards and my overall impression of the hardware was good. It seemed well shielded and engineered in general... I have a vague recollection that the floppy on the front was used for an IPL [Inital program load, (booting up enough stuff to be able to start an install from tape).], and possibly loading the Microcode....

Without any serial numbers its hard to know...

what to use it for...

If it works its probably fine for lots of things like database stuff, programming, learning mainframe/mini stuff...

Of course a 486 with 8 MB of ram and a 300 mb IDE hard drive running linux would probably beat the pants off it, _AND_ suck a hell of a lot less power....

There is the coolness factor too. Nothing's cooler than saying to somebody 'Yeah thats my computer over there....' and seeing there eyes pop out... when they realize it isnt a beer fridge.

Chuck your 8 bit and monitor on top of one of the cabinets,throw in a star raiders cartridge, and then put your feet up on another cabinet..
now thats computing...

2018. ANSI Compiler for 8-Bit Machines?

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-12 00:00:00 UTC
From: cr@interlog.com
Message-ID: <1dn3b6i.1wj4e8gzy9picN@ip203-99.cc.interlog.com>
Source record: 54829
Cross-posted to: comp.sys.amstrad.8bit,comp.sys.atari.8bit,comp.lang.c

Hello.

I'm posting this to the relevant newsgroups, please post followups to comp.sys.cbm, or directly to my email address.

I'm interested in knowing if there was ever a full ANSI 'C' Compiler, for any 8-bit machine, specifically those running x502 processors. IE: 6502, or 8502, any variant, any speed, and any system architecture.

I'd like find this info out, in the hopes of porting such a package to the Commodore line of 8-bits. I know, I know, there are at least two C compilers for the Commodore, and another set of compilers for CP/M, but none of them offer full ANSI compliance. The closest thing I've found is HI-TECH C for CP/M, which does not have an option for producing x502 based code, only Z80 code.

Can anybody recommend anything?

Thanks,
Patrick

PS: No news about cross compilers pls! There are already enough of those floating about! I'd like one that runs native to the destination processor! :)

Furthermore, perhaps you appropriated the REAL Patrick Robbins' Wang for your own evil purposes. And now you seek to wreak unspeakable evil deeds using the power of his Wang. You desire to wield the Wang mercilessly in your rampage of terror. For, as we all know, a Wang in the hands of the wrong person can cause untold amounts of chaos and mayhem (just look at what Clinton did with his Wang, for example).

Yes, they have.... I had, years back, the Mosaic board... gave me 64k.. but,
it's not Axlon compatible.. the onlyy way to access it was via their DOS... I
sold it off years ago when I got my 800... however, I pulled the 400 out, for
my daughter, and bought Atari's 48k kit.. simple.. pull out the old board, put
in the new, and install 4 jumper wires on the M/B.... literally done in 10
minutes...

>If it's the former, the C64 doesn't have this limitation, I've been
>assuming the latter.

your latter comment is still not entirely clear. But I believe you're
enquiring if Atari sprites must be the same resolution as the
background. If this is the case, then the answer is no. The resolution
of Atari sprites have absolutely no bearing on the background
resolution and vise-versa. In fact, part of the definition of
(hardware) sprites is that they are an entirely separate entity and,
therefore, MUST be able to support their own resolution.

As for fine scrolling, the the Atari is *normally* set for a 160x192
resolution (discounting overscan). The only divergence from this rule
is the funky GTIA modes with a resolution of 80x192 (again,
discounting overscan). If one tries to horizontally scroll such a
screen by a single color clock, the entire screen will magically
change coloration and will not physically change position on the
screen. In order for the screen to change its horizontal position (and
maintain its color integrity) a two color clock shift (which
corresponds to the horizontal resolution of a single GTIA pixel) must
occur.
```

I have to admit I fudged a bit. You are correct about the signal
bandwidth being more of a factor concerning color artifacting. In
fact, when the computer is connected to a monitor that supports
separate chroma/luma input, the color artifacting virtually
disappears. Still, my previous explaination does have its uses.

>A bit of trivia: CTIA 400/800s artifacted in blue/green, GTIA 400/800s
>artifacted in green/blue, and all XL/XEs artifact in red/blue.
>
>Regarding C64 sprites, for what it's worth, doubling the width of a
>single-color sprite so its pixels were equivalent to that of an Atari P/MG
>would indeed make it 3 times wider.

This assumes the C-64 sprite was "locked" into a single color mode and
not the 3 color mode which is more normally used in C-64 games.

>Pardon me, but wouldn't an 800 be better to buy

Absolutely.... BUT.. some folks, like myself, like to push the envelope! Read my next post... at THAT time, the 400 was cheaper to upgrade than buying an 800... well, that was 'til a few years later!

Today.... no question, get an 800...!!!!!!!!

Not really. You're using the parralax effect and memory of a previous
image to simulate stereoscopicity (is there such a word!?).

2033. New ATARI-FileManagement

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-13 00:00:00 UTC
From: HCRBurk@t-online.de
Message-ID: <7a2veg$h44$1@news01.btx.dtag.de>
Source record: 54749

Hi atarians!

A new release of the Filemanagement (1.5 0128 - Windows 9x) is complete.

Features:
- Freeware
- Management of XFD/ATR files
- Lists directory structure (DOS/MyDOS/SpartaDOS)
- Import/Export (ASCII, Binary) for DOS/MYDOS/SpartaDOS
- Management of tools for work with other programmes.
- Serial communication (like SIO2PC) between PC and ATARI, it simulates up
to 8 floppy disk drives
.. and much more.

For the ATARIMAN.ZIP file look at my Homepage:
http://home.t-online.de/home/hcrburk/hpatari.html
or http://members.aol.com/MacFalkner

I soon make a DOC available.

Please give a feedback if you find bugs or if you have other suggestions.

thanks,
bye, Burkhard

Not so easy... if you're going to get it screen printed... it'll cost a fortune... that is, for one shirt... an artist has to do the artwork, make acetates, burn screens, and pull squeegees to get that print on one shirt! And, of course, you have an Ok from Atari, er, Hasbro is it? ;-)

Aaron:
> ...I believe you're enquiring if Atari sprites must be the same
> resolution as the background. If this is the case, then the answer is
> no. The resolution of Atari sprites have absolutely no bearing on the
> background resolution and vise-versa.

So why, when I drew a diagram of physical sprite widths, did somebody (I believe yourself) *change* it so that the Atari players were twice as wide when they had more colours? I'll draw another one.

monocolour sprite: ************************
multicolour sprite: ************************
single col. player: ********
multi col. player: ********

By "physical" I mean what you can actually see. IF you measure a PMG it's a constant width, on a 320x200 (or similar) screen it's 8 pixels. The same goes for a sprite, it's *always* 24 pixels across no matter how those pixels are being interpreted. 24/8=3.

> As for fine scrolling, the the Atari is *normally* set for a 160x192
> resolution (discounting overscan).

I was talking about the C64's smooth scroll. Even when you're seeing what looks like 160x200 screen displays, the C64 is still pumping out 320x200 resolution, the smooth scroll and option of mixing modes prove this.

Working in cartridge mode mean no I/O....Possibly a bad Pokey?Hmmmm...
But it knows a drive is out there...

How does the atari ask 'whos out there'? Polling for status checks? If
so, the status check must have gone thru well enough to keep the 8-bit
talking..

Puzzling...

That used in Sparta is easily enough disassembled, either from disk (it's the second load and go segment) or by saving the OS RAM from $E459 to somewhere around $E459+300 and then disassembling that.

John

It sounds simple but, try disconnecting and reconnecting the SIO cable.
Also (this is so easy it's often overlooked) check the drive select
switches are set to D1: (both switches pushed to the left on a 1050).

Visually PMG player occupies 16 pixels across in resolution 320x192
but has own resolution only 8 pixels across so one PMG pixel equal to
two pixels in resolution 320x192. If doubled, one player occupies 32
pixels and quaded 64 pixels. i hope you understand to me :)

Hi,

There is CC65 for XL....

Look at umich FTP site to download...
All source(s) are included. It will compile to assembly and there is a
assembler, linker included.
When looking around you will also find a MAKE command and more just like on
PC...

Gtx,
Sysop*TXG

All items tested and work (unless otherwise noted)

Hardware:

Key:

B - includes original box
M - includes manual

Magnavox RGB 80 Monitor - works on both 128 and 64: $50
1902A Monitor - due to water damage, screen is shrunck: $20
Commodore 64 - no p/s and needs new keyboard: $10
Commodore 64 - great condition, p/s included: $20
Commodore 1571 - works sometimes, other times, it does not:
$10
Commodore 128 - water damage, parts only with p/s: $10
Epson 286e Printer - does not work: $10
Vic-1525 Printer - BM Powers up, computer recognizes it, but
will not print: $10
Intellivision system - works, one cartridge has exposed
wires, includes "Tron Deadly Discs" cartridge: $20

VIC-20 Cartridges:

Key:

B - includes Box
M - includes Manual

All prices based on rarity status and above.

Pole Position - BM: $3
2 Sargon II Chess - BM: $3 include BM, $1 cartridge only
Cosmic Cruncher - B: $2
Omega Race - BM: $3
Radar Ratrace: $1
Raid on Fort Knox - BM: $3
Clowns - BM: $3
Hes Writer - BM: $4
IFR Flight Simulator - BM: $5
Mole Attack - BM: $3
Jupiter Lander - B: $2
Choplifter - does not work; cartridge board half in case
B: $1
Avenger - BM: $3
The Count(text version) - BM: $3

Gorf - BM: $3
Supersmash - B: $2
Quizmaster(tape) - BM: $5
VIC Lemonade (tape) - BM: $5
2 Adventureland - BM: $3 includes BM, $1 Cartridge only
Programmer's Aid Cartridge: $1

Atari 2600 System:

Key:

M - includes Manual

A six-switch system includes power supply, paddles, a
Tac-10 Joystick(or similar), and the following carts:

2 Space Invaders - Text label
Berzerk - graphic label M
Defender - graphic label M
Combat - text label M
Missile Command - graphic label M
2 Pac-Man - graphic label M
Circus Atari - Graphic label
Super Challenge Football
Asteroids - graphic label M

Price: $35

Other Cartridges:

Key:

M - includes manual

Super Mario Brothers for Nintendo 8bit - M: $2
TI Invaders cart for a TI computer: $1

I will accept individual requests, or sell the whole lot
for $260. Prepay only.

2053. Wanted: 1400XL or 1450XLD

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-13 00:00:00 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-130219991529319171@ccm19015.humboldt.perki.net>
Source record: 54769

The subject line says it: I'm looking for a 1400XL or 1450XLD to round out my collection.

At the World of Atari show, I bought a hard-to-find 800XE at auction, but missed out on a 130XE with Arabic keycaps and nameplate. I wouldn't cry if another one of those came my way.

If you have any of these items for sale, please e-mail me.
Kevin Savetz

To everyone who reads this....

Saturday, February 13th 8:00pm
We invite Jim Collins, Chromagic to join us to
discuss new Atari products and hardware/software
availability from the States and overseas.ï¿½ Jim is a
well respected provider of Atari goodies and
upgrades.

That's at 8pm central standard time, TONIGHT on

http://www.atariusers.com/chat

Or get there by going to...

http://www.atariusers.com/aunt

... and select "main area" in the chat menu on the left side of the
screen.

Hope to see many of you there!

Atari Users of North Texas... bringing Atari into the next century!

2056. atari8-l mailing list

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-13 00:00:00 UTC
From: krap@zwieracz.ideefixe.nom.pl
Message-ID: <7a4gb9$mr1$1@zwieracz.ideefixe.nom.pl>
Source record: 54772

echlo

i'd like to invite all of you to atari8-l mailing list.

it's probably the biggest atari 8 bit related mailing list in the world -
- connected bidirectionally to old list at MARIST, and gatewayed to the
FidoNet(tm) international ATARI8-L echo.

for now it has about a 100 subscribers, from all around the world. the list
is free from all the F/S messages, and other off-topic discussions, so
you can find there pure atari8 related stuff... all the messages comes right
to your email account, so there is no need to contact a newsserver, there
is no old-messages deleting, and so on... my wish is that every atari user
would be subscribed, so the atari community stay together and grow in
strenght.

if you maintain an atari8 related WWW site, please put some informations
about the list on it - i'll help others - not everyone has access to
usenet.

to subscribe, please send the message to majordomo@zwieracz.ideefixe.nom.pl
with the following line in the body (not the subject) of your message:

subscribe atari8-l

the language we use is, of course, english. the list is fast, reliable,
regularily maintained.

please, share this message with all people that are interested in atari8
topics you know, and help make this mailing list wide known.

I want to converte pictures from AMIGA/ATARI ST to the XL.
The problem I have now : How to get the right colours on the XL screen ?
The RGB values are different to the colour system the XL uses.
Is there a way to calculate the correct colour ???

Actually, the Atari literature is the only place I have seen this
curious (and in my opinion quite confusing) terminology. I think
the term "pixel" long predates the computer, and to most sane people
refers to a glowing phosphor dot on a television or computer monitor
(certainly to any computer layman such as myself).

On the 64, every two pixels are the same color in multicolor mode,
giving an effective resolution of 160x200. It's even represented
that way in computer memory (as opposed to e.g. bitplanes).

It's only on the Atari that you can get strange sentences like
"screen size is 40 pixels by 24 pixels" and "register x will change
the width of the pixels."

As this thread has shown, bad terminology leads to very lengthy and
awkward discussions and descriptions. When you need three pages
to explain a very simple concept... it's time for some new terminology.

USB is a bus design, not daisy chain. This machine would need quite a
few USB ports to get around not having to buy a USB hub.

Received a while back from a Wang VS enthusiast. There are quite a few
out there. They made several different machines including a line of
PC-like ones that are pretty outmoded. If ,as it sounds like, you have
a VS, consider yourself fortunate. And, sorry to tell you gentlemen,
especially the "boat-anchor" wise-acre, it can run rings around any
"home" computer. Check out the URLs and links.

ciao larry

Some new SVGA monitors have a four port hub built in. Cyprus
Semiconductors makes some USB interface chips, and have a link to the
USB standards. At the speed of the buss I would use it for some things,
but not for CDROM or Hard Drives. They would use up too much of it's
resourses. If you want a great machine build in four IDe and a SCSI port
to let the use decide what they want in their configuration.

The Atari DOS 3 Master Disk should be able to boot the 800XL.

You should power on the 1050 first, insert the diskette and then power on the 800XL (remove any cartridges first!). You should hear rapid, short beeps as the disk reads, then the "Ready" prompt should appear. Type "DOS" and press "Return" key and after some more rapid beeps the DOS menu should display.

If this doesn't work let me know if any diskette will start for you and I will let you know the files that are on my DOS 3 diskette.

The odds are it can't as it sounds like the third in a set of disks.
Generally, with a set of disks, only the first will boot. That's assuming
the "Master Disk 3" is on a manufacturer's label. Your best bet, after
trying the various tips that have been posted here, is to find someone in
your area with a working copy of DOS who can run you off a boot disk.
Better still, if you can visit the person, take your drive and computer
with you and try them out in varying combinations with his equipment.

Probably a FAQ but.. Are these actually still obtainable? How many were actually made? I would consider paying a fair amount of money if a 1450XLD came my way.. I still have the MACE journal (I think it was June '83) that gave the sneak preview of all the stuff Atari never made.. I still drool over that sometimes.

Here's some handy macros. If you study them carefully you'll see that the
first one splits a file into odd and even files with 80 line pages, numbering
each page in the process. The second one prepends the two files with the
printer's ESC sequence to turn on 88lpp before writing them indiviually. Print
one file, turn over the paper and print the other. Feel free to use them, I
don't know if they work on older versions than 4.0.

>monocolour sprite: **********
>multicolour sprite: **********
>single col. player: ********
>multi col. player: ********

NOPE! Please understand that a PIXEL is a separate visual entity on
the screen. On the simplest level a pixel can be represented by a
single bit for the purpose of a monochromatic display (ie. a display
where any single pixel can be either the background or foreground
color). By combining a number of bits for the representation of a
single pixel, the computer can be coaxed into displaying multiple
colors.

Most older computers have a stringent upper limit of how much RAM can
be accessed for the purpose of a (non sprite) video display
(BANDWIDTH?). The upper limit for unexpanded Ataris and Commodores are
about 8K. Therefore, in order to increase the number of displayable
colors, one must sacrifice the resolution (ie. the number of
separately accessible pixels).

Sprite limitations are even more stringent. A single C-64 sprite
MUST consist of exactly 63 bytes. In single color mode, each bit can
represent a separate pixel for a total pixel resolution of 24 pixels
horizontally and 21 pixels vertically. Because a single C-64 sprite is
always represented by 63 bytes, when a sprite is set for multicolor (3
color) mode, the number of separately definable pixels must be
sacrificed. This resolution sacrifice occurs in the horizontal
direction, thus cutting the number of horizontal pixels in half (from
24 pixels down to 12 pixels). To make a long story short, your above
use of the number of asterisks to represent a multicolor C-64 sprite
should be reduced in half.

Please note that both Atari & Commodore sprites can be made "larger"
by stretching them in both the horizontal and vertical direction.
However, because the number of bytes representing them are the same,
each pixel is visually "fatter." Also note that "unstretched" single
color C-64 sprites can be displayed at a higher resolution than
"unstretched" Atari sprites (ie. a single C-64 sprite pixel is half
the size of a single pixel Atari sprite). In multicolor mode an
"unstretched" C-64 sprite pixel is exactly the same size as an
"unstretched" Atari sprite pixel.

single colour C-64 sprite:(24 pixels across) (not horizontally
expanded..physical width of each "x" represents two single color
pixelsl)
****
single colour C-64 sprite: (24 pixels across) (horizontally
expanded...each "x" represents a separate single color pixel)
****
monocolour C-64 sprite: (each "x" represents one multicolor pixel)
****
single colour Atari player: (each "x" represents one single color
pixel)
****
multicolour Atari player: (two Atari sprites are placed on top of each
other to produce a three color sprite)
****

>By "physical" I mean what you can actually see. IF you measure a PMG
>it's a constant width, on a 320x200 (or similar) screen it's 8 pixels.
>The same goes for a sprite, it's *always* 24 pixels across no matter how
>those pixels are being interpreted. 24/8=3.

The highest resolution of an Atari P/M sprite corresponds to a
background resolution of 160x200. Atari scrolling is always set at
160x200 res. The highest res of a C-64 sprite corresponds to a
background res of 320x200. C-64 scrolling is always set at a 320x200
res.

C-64 sprites always use 3 bytes per horizontal scanline. 3 bytes
correspond to 24 bits. In sprite mono-color mode, this corresponds to
24 pixels across. In sprite multi-color mode this corresponds to 12
pixels across (each pixel is interpreted from 2 bits of the 24 bit
holding area). If one wanted to have a multicolor sprite at 24 pixels
across, 6 bytes would be needed. A single C-64 hardware sprite does
not support this. The workaround would be to place two separate C-64
multicolor sprites side-by-side.

6
We certainly have a screwy definition of resolution. Don't we?

By your definition an Atari 2 color 40 x 48 display is still a 160x192 resolution because it can be fine scrolled as such. How laughable. Or, perhaps, you're equating video memory size with resolution? After all, a multicolor 160x200 does use the same 8K amount as a mono 320x200 resolution. Right? Using this faulty logic, the Atari 16 color 80x200 (using 8K of RAM) must therefore also have a resolution of 320x200. Of course, in terms of discussing resolution, this is unequivicably erroneous.

This is the same reason why many people bought the IBM PCjr (aka
"PEANUT"). At the time (1984) an expanded (non HD) PCjr was much
cheaper than a comperably equipped PC (non HD). It's hard to believe
that at the time (1984) hard drives (HD) were considered to be
incredibly expensive luxuries and, with very few exceptions, all PC
software (and DOS) could be run directly from floppy. Nowadays, a PC
program can't even be directly run from CD!!!

You have GOT to be kidding!

CHONG..CHONG..CHONG..CHONG...VAMPOW (Space bar)..CHONG..CHONG..

Well.. I guess I liked the keyboard quite a lot, but after going from
the Atari 400 to a 1200 keyboard (membrane to touch type) I smoked that
poor Mac 512K Keyboard. We had a second keyboard for parts every time a
key went out.

Now my current MacAlly keyboard has held up surprisingly well...

HELIOS ALL THE WAY MAN!!!

(Atari/Unix combo for the Atari Workstation... which, BTW, if anyone is selling I would be curious to hear the price...) :)

I'm torn at the moment.. I mentioned this in the letter to the Atari listserve.. to sum up a large letter, I was thinking between a Mac, PC, Atari 8bit with a black Box, and a Atari ST platform.

I've found that these days, computers are toasters. This holds true for the PC and Mac. They will do the word processing, internet, and high graphical applications.

Then you have what I'm starting to call the HOBBy machines.. The Atari, Amiga, (Newton), and all platforms that are in their own way unique and different from PC and Mac. Mac used to be in this rare category... but quite frankly they have become a VERY common computer. Congratulations Mac, for I was a Mac user when Mac users weren't cool. Now they are, and I don't like it!! :)

So, my thinking is this.. love Macs... my lady wants to green imac (she likes the different colors.. she thinks they're cute). I figure get the iMac for the very fast web browsing, and get a Atari TT and upgrade the hell out of that machine for a hobby machine (and that machine is also quite internet capible, though not on par with a iMac by any means).

Cool to still have Atari as a option in this day and age...

>atariwriter, and others.
>
Some questions to hopefully rule out some
potential sources of your problem:

Are you saying that when you swap the
computer*and* drive with the same disks
that you still get the error?

Is the exact message "BOOT ERROR" or
something else?

Which drive do you have - 1050 or ?

If a 1050, are there any other switches on the
front of the drive that look like add-ons?

Have you checked the small slide switches
at the rear of the drive to make sure that it
is set for drive #1? On a 1050, they are
black and white. They should both be
pushed LEFT with only the black switch
showing (the white one is directly behind it.)

If you haven't solved your problem already,
let me know the answers, and we'll pursue it
further.

From: Bob Klaas <bobkla19@sisna.com>
Message-ID: <36C6CBAE.91EE94AB@sisna.com>
Source record: 54783

Appears you have 1 or two problems.

1. Your disks are corrupt.

2. Both your disk drives have a read problem.

Look at the disks first, check the area on the other side of the disk
with the label facing down.
Look for scratches at the outer edge or a worn line on the disk that is
not the same color as the rest of the disk in the read hole. Turn the
disk by placing your fingers in the center hole and look again for any
worn or scratch spots on the outer edges.

2. Remove the 6 screws from the 1050 disk drive, lift off the top cover
and look at the Head in the center of the drive. With cover off put a
disk in the drive turn on power, Does the head move to the rear of the
Disk, then move to the center after a few seconds? If not then look at
the rails the head travels on, they could be dirty and prevent the head
from reading track zero. If this is the problem then
clean the head rails.

3. Turn the drive off remove the disk and lift the Upper arm of the head
gently, look at the head itself see if it is dirty, if so clean it, also
look at the top arm you gently lifted, there is a brown pressure pad in
the center of it, does the pad still exist, and stick down a little? If
not then it is possible this is the problem and the pad needs replaced.

4. On the same arm on top of the head you will see a spring that applies
pressure to the arm, behind the coils is a wire that is in one of the
slots cut in the back of the head base, you can move this to the right
with the front of the drive facing you, this will apply more tension to
the head if the pad has worn down some letting the disk travel over the
head.

5. Before all of this, look at the center hole of the disk in the drive
when you turn it on, it should spin if it does not then you have lost
the drive belt, depending upon the Mech. you have it could have just
come loose and be lying in the base under the drive Mech.,

hope one of these help
bob.

Nope the subject name is the right one. Hacked wise there are many
around BUT I think they all stem from the same bugged version. I seem to
remember the game starting on level 7 for some reason and resetting back
to he same level if you finished that level..

Wasn't that good at it TBH so it could be me, anyone who owned the real
version like to say if that's how it played as norm?

: >

: B-key Keyboard? Is there a way to get past the membrane keyboard? I assume
: its possible (I'm an engineering student)... I just never thought there was
: an easy way to do it. What's involved in the upgrade?

: The reason I've asked is because I'm trying to reassemble my Atari 400
: system. I sold all of it 10 years ago... <sigh> When I bought it, it was a
: 48K. The only thing I've found to be reasonably priced and guaranteed
: working condition (as opposed to untested) was a 16K system, so I've ordered
: it, but I would really like to have that extra 32K of ram.
:
: (Thanks Vinnie and Curt... I contacted best. I haven't found the exact
: part, but I sent them a message)

: Another nice thing to be rid of would be the membrane keyboard... So what is
: the B-key keyboard? ;-)

: thanks again,
: bret

The "B-Key" keyboard was a product sold by "Inhome Software" a local to
the Hamilton Ontario area which made a lot of money on them. They were a
replacement keyboard that were pretty good, but not as good as an 800
Keyboard....kinda stiff, but MUCH better than the membrane. The only way
to upgrade a 400 now a days is to locate one of these replacement
keyboards.....not an easy task.

--

Hi 2 u,

I�ve got a little problem with the Atari ----XLE---- version of Star Raiders.
I friend used his cart. for about 10 minutes and it burned out. A other friend of me had the same cart. (Aehh another one not the same). I opened the cart an there was only 1 2364 chip from NCR inside IC602, the IC 601 was free. I had pulled out the rom a took a eprommer to read the Data, Ok i burned a new eprom for the burned out rom in the other cart. but after i nplace the orig, rom in the cart, nothing !! (i have now two ex friends with no Star Raiders XLE)
So i come to an end with my questions.

1) Why has the XLE version of Star Raiders only 1 rom (4KB) when the 400/800 version has two?
2) Has someone a idea why the cart. don�t want to run after i had made a copy (is it a new not known copy protection)?
3) Is there a source for the cart pcb layout for Atari 8 Bit cartridge games.
(I�ve seem many rev. and would like to make a docu, if it isn�t already there)

bye

King kong (Germany)

Off topic(ish) but have you heard about that card that you can put in a PC. Add a k/b and mouse and you can have two people using the same PC/Windows at the same time. It has it's own video card built in too albeit a weedy one.

Don't forget, the Internet only exists in the US, or that the world == the
US. Seems to be the opinion in certain countries anyway ;-)

The most depressing thing is using chat on AOL:
"Hi where are you?"
"UK"
"What state is that in?"
"No, not in US - Great Britain"
"Do they have the Internet in England?"
"err yes.."
"You know Bill Gates invented the Internet don't you?"
etc

There's a new one that is cheapish (£600 UKP) and takes PCI peripherals and runs a 68040 at a fair speed. Something like 6 times quicker that a Falcon.

I've got both parts (A-G and H-Z) of a French Publication called "La Bible des Pokes" which was published in November 1992 by Joystick magazine. Each half has glossy magazine-type covers and contains 81 pages (162 sides) of A4, covered with pokes and solutions for an *enormous* range of Amstrad CPC, Commodore C64, Atari, Commodore Amiga and PC games.

I estimate there are about 700 pokes or solutions in each volume. 'Course, you'll need to read French for some of the solutions, but a poke's a poke, right?!

Anyone like to make me an offer for them?

E-mails to brian@spheroid.demon.co.uk please.

>That's the nature of a disk-based operating system.

Yeah SLOW! But GEOS is not bad. I used 1.3 for years on one drive. And then I got 2.0 and used that for a year before I got a 1581 drive. Then shortly after that I got a 1750 REU. When you are using one drive you figure out tricks to speed things up, and advoid disk acess. Once you got those tricks down it was not bad. I admit that the best thing is to get a 1750, but you can still use it with one drive.

BTW-Geowrite is best with page breaks! If you have a ramdrive you don't need to bother with them tho.

> (certainly to any computer layman such as myself).

To Atarian's that would mean the monitor/TV's resolution, which might be different from the computer's current screen mode resolution.

Hmmm.. I'm not sure if "pixel" predates the computer or not, I always thought it was created when people started working on the early computer graphics systems. But I guess it might go back to the days when the TV was invented. Anyone know for sure?

I've always understood the word pixel to have originated from the words 'picture' and 'cell' (pic-cell or pixel), there have been other variations of this used in the past, such as pel (from picture cell or picture element), but pixel has been the one that has stayed with us. So a pixel (or picture cell) is the smallest individual element of a picture. i.e. a dot. But does this mean the smallest physical picture element that can be displayed on the screen (an RGB triad), or the smallest logical unit that the computer can manipulate in a picture (which can be 1 or more RGB triads, or even fractions of an RGB triad depending on the resolution of the mode used)?

Having taken the Atari route, I've always assumed the latter, although I can see how it can be applied in terms of the former. Given all the different Atari screen modes, I can see how it would make sense from Atari's point of view to define it as a logical picture unit. This way the PLOT 10,10 command would draw an (Atari) pixel at x=10, y=10, whether that (Atari) pixel is 1 (C=64) pixel big, 4 (C=64) pixels big or whatever. Then you can say it switches (Atari) pixel 10,10 on, rather than (C=64) pixels 40-43,40-43 on, or whatever.

> On the 64, every two pixels are the same color in multicolor mode,
> giving an effective resolution of 160x200. It's even represented

>

> It's only on the Atari that you can get strange sentences like
> "screen size is 40 pixels by 24 pixels" and "register x will change
> the width of the pixels."

And taken in the context of Atari pixels, it makes sense, and
there's nothing strange about it. Even if the rest of the world
disagrees :-)

> As this thread has shown, bad terminology leads to very lengthy and
> awkward discussions and descriptions. When you need three pages
> to explain a very simple concept... it's time for some new terminology.

Actually I'd say that this thread has shown that the different
terminologies used leads to... As someone else in this thread said,
it's not better or worse, just different.

Hmmm.. all this has got me wondering. We talk of resolution in terms
of pixels, a resolution of 320x200, means 320 pixels by 200 pixels
(i.e. you can resolve 320 elements by 200 elements). Does that mean
that if I connect my Atari, or a C=64, to a modern monitor I can say
I've upgraded it to a resolution of 1480x1024 pixels? :-) *grin*
Hey! my Atari can do 1480x1024!!! ;-)

> (which can be 1 or more RGB triads, or even fractions of an RGB triad
> depending on the resolution of the mode used)?

my impression was that pixel was coined for computer type
representations
(it came after computers)

pel was borrowed from printers (and predated computers) to refer to the
elements of a particular graphic as opposed to the number of pixels
possible
for some piece of hardware.

Originally (I think), resolution refered to the minimum size that could
be resolved. When applied to monitors/displays it was more of an
absolute
measure and meant the number of dots per inch. So a 7" monitor that
could
display 300 pixels horizontally would have twice the horizontal
resolution
of a 14" monitor that could display 300 horizontal pixels. (but few
people
have used "resolution" that way for 20 years or more)

These things shift with use (or misuse) the important thing (in my view)
is
to be aware of that, and make sure every one agrees on the current
usage.

> Hmmm.. all this has got me wondering. We talk of resolution in terms

I have the version 2 cartridge, there was also a third release which was I
think more compatible with things.

It's cute, and it's kind of fun to use an Atari-brand mouse with your
8-bit, but I couldn't make it work well with much of anything else I was
using at the time.

You can view GIF pictures on an XL with Jeff Potter's APACVIEW or JVIEW,
which should be on the umich.edu site (don't remember the exact URL, but it's
in the FAQ.) These programs can also convert gifs into forms that are more
easily viewed and manipulated on the 8-bit (it can take minutes to decode a
GIF!)

Not at all.
Screen-mask resolutions are described with DPI (Dots Per Inch).. just
like printer-resolutions.

PIXEL is the word for a dot drawn by the computers Hardware (Marc called
them "screen adressable points").

> that's highly mutable. Trust me, the use of the term pixel to describe
> the smallest addressable element in any given resolution is... well,
> the very definition of "pixel"! (And yes, it is a contraction of "Picture
> Element").

A PIXEL is drawn by the hardware of your computer.

Let's say your Monitor could display a maximum of 640x400 pixel, but the C64 can only display a maximum of 320x200 pixel in hires-mode.. no matter which monitor you use.

Then it would be correct to say "A pixel in Hires mode is 2x2 dots on my monitor"

If I have a 15" Monitor, I have a visible field of

11.713" x 9.37"

So in x direction my monitor has 640/11.713 = 54,64 dots per inch
in y direction my monitor has 400/9.37 = 42,69 dots per inch
Means: I have a monitor with a 2347.3344 dots per square-inch mask.

The manufacturer would probably say "2400 dpi-display" (and count some unused dots at the borders).

A 17" Monitor that can display a maximum of 640x200 dots would have a lower resolution than 2400 dpi.

So.. a Monitor resolution is given in dots per square inch. A computer (or graphic-card)'s resolution is given in X * Y Pixel.

Source record: 54641

Hi All--

I recently acquired a pair of old Atari 2600 Driving Controllers, and was going to gut one to make a cool Tempest Controller (I have the PC version, and the mouse don't do it justice :)

So, I should have one left over for my Atari computer.... Are there any 8-bit games that use the driving controller? The driving controllers have no stops on the dials, which differentiates them from the paddles.

Thanks for you help,
Steve

Maybe a moot point by now, but Pixel is a contraction for "Picture Element."
I know that could have a bunch of applications: memory in hardware, data in
a GIF, phosphors on a monitor. As far as I can remember it refers to an
individual phosphor element of a Television tube....I believe I've seen it
in literature from the early 40's....

There is no such beast as "the 800XL printer port". Available ports are:

Joystick/Paddle (2): hooked up to PORTA of the PIA for data and to GTIA
for trigger lines as well as connections to capacitors for the paddles.

Serial (1): hooked up to POKEY for data in/out and clock (unused). Also
hooked up to the PIA control lines, one of which is used for the SIO
equivalent of a strobe, one for cassette control and two unused.

Cartridge (1): usable only with cartridges or devices specifically
designed for the port.

Parallel (1): usable only by devices such as the Black Box or MIO.

Hooking up a printer is normally done using an interface hooked up to the
SIO port or via a Black Box or MIO. Other options are to use a PC printer
via SIO2PC or APE or (rarely used) to hook up a printer to the 80-column
adapter (XEP80).

The "second half" of the PIA (PORTB) is used as a latch for RAM and ROM
control. As such, it is programmed for output.

John

2124. Facts Sheet 93 & VCS singles

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-16 00:00:00 UTC
From: inf410@worms.fh-rpl.de
Message-ID: <7abjue$6sl$1@villon.Fh-Worms.de>
Source record: 54729

Hi,

I&#65533; ve two singles with songs for Atari Vcs games (Space Invaders -english- and
Pac Man -german-). The Space Invaders song (side a) is very good like some songs
from Asia or from other metall groups, the song on side b is a little weaker. The
Pac Man song is very - aeeh boring -. The song is made like songs of the "Neue
Deutsche Welle" and the man who sings the song isn&#65533;t known in Germany.
-Are there any other songs out?

I also own the Atari (Time Warner) facts sheet revision march 1983. It is
very interesting because there are the targets for the Atari VCS in the next
years.
-Again, are there other fact sheets out for 1984 and 1985.

I think i&#65533;ve seen a proto(i am not sure if it is a proto) for 1 meg bit (128KB)
cartridges.

-Stop there is a question that is burning under my nails, is there a source in
-Germany that sells the cpu of the XF551 a 8050 0r 8040 Intl chip (sorry this is
-more for readers from Germany)

Hey don&#65533;t forget the Atari 8 Bit fair in Schreiersgruen 1999. It is held in
Schreiersgruen (really - really ? :-)) the fair had in the last three years
about 210 visitors (75 , 75 , 60). There are people from the ABBUC, the atari 8
bit source in Germany. Abbuc has 480+ members from Germany and the rest of the
world (we have more German than other members).

Visit the homepage from Raimund Altmayer (http://www.atari-computer.de/highlander/)
or me (http://www.fh-worms.de/~inf410/atari8b.html)fore more info both are in
german but the pic&#65533;s are international.

thanks for your response.

King kong (Germany)
(hope there are less errors inline)

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

"Screen Addressable Point" (SAP)
eg C64 High Resolution Bitmap Mode contains 320x200 SAPs
C64 Character Mode contains 40x25 SAPs
C64 Multicolour Sprite contains 24x21 SAPs that are the same size
as those in C64 Multicolour Bitmap Mode

"MOB (Moveable Object Block, aka 'Sprite') Addressable Point" (MAP)
might help dissipate any lingering confusion. :)
eg A MAP is sort of like a SAP

Then, if you don't mind my saying so, you haven't been reading a
sufficiently wide variety of literature.

> On the 64, every two pixels are the same color in multicolor mode,
> giving an effective resolution of 160x200. It's even represented
> that way in computer memory (as opposed to e.g. bitplanes).

I think what's confusing the C64 folks is that that system only supports
a paltry two screen resolutions, as opposed to the Atari's dozen or
so. Hence, they've never learned to conceive of a pixel as something
that's highly mutable. Trust me, the use of the term pixel to describe
the smallest addressable element in any given resolution is... well,
the very definition of "pixel"! (And yes, it is a contraction of "Picture
Element").

> It's only on the Atari that you can get strange sentences like
> "screen size is 40 pixels by 24 pixels" and "register x will change
> the width of the pixels."

And in this obscure OS I'm currently using. "Windows" or something like
that...

> As this thread has shown, bad terminology leads to very lengthy and
> awkward discussions and descriptions. When you need three pages
> to explain a very simple concept... it's time for some new terminology.

Actually, the confusion arose from incomplete or incorrect understanding
of quite sufficient terminology. It didn't help that one of the fellows
leading the argument didn't even know what a "color clock" was.

I believe they use "dpi" (dots per inch) to describe that concept now,
although resolution is still frequently used (as in, "This monitor has
a maximum resolution of 1280x1024").

>does anyone remember an atari 8-bit utility that re-programmed a Happy
>drive to emulate a SpartaDos drive (i.e. US Doubler)?

Yes! I was looking for that same program
recently, as I now use an upgraded XF551
with my "Happy" 1050. The name I
remember was the "Happy Doubler".

If you still have the utility, I sure would
like to get one from you. I mainly need it to
format disks with Ultra Speed (on the back
of the disk which a 551 won't do.) You can
contact me at my email address.

Hope you've still got it!

Thanks,
Larry White

But the point is that I don't need to see from 2 vantage points
simultaneously to perceive the 3-d location and shape of objects.
Therefore, I can achieve real depth perception with 1 eye closed and by
moving around.

It would be correct, but really... who would care? Phosphor resolution varies
wildly from one monitor brand to the next. Color clocks do not, so why not
use them instead?

[lots of irrelevant math deleted]
> So.. a Monitor resolution is given in dots per square inch. A computer
> (or graphic-card)'s resolution is given in X * Y Pixel.

You seem to have gone to an awful lot of effort to prove points which were
never in dispute!

Correction: A C64 Multicolour Sprite contains a matrix of 12x21 SAPs, each SAP, at its finest resolution, being the same size as a C64 Multicolour Bitmap SAP.

A C64 Single Color Sprite contains a matrix of 24x21 SAPs, each SAP, at its finest resolution, being the same size as a C64 High Resolution Bitmap mode SAP (or half the size of a C64 Multicolor Bitmap Mode SAP).

Sorry if I'm getting a bit sappy. ;-)

The one I have, has a 6520/6522 (PIA or VIA)[sorry I cannot remember which without looking, but only one would work]. It had PBI decode logic a one end, at the other end of the board there is 5 volt regulator which you plug in external power ie. 9Volt battery. The board has a work area for wire wrap as I remember. All the 6520/6522 user connections came out on a 25pin Dtype comnnector.

The PCB seemed very well made. I had to build mine my self but it wasn't hard (Use IC sockets!). I seem to remember the instructions wern't to hot, vague memories now:-(.
Oh it only has an XL PBI connector to attach to the computer, but there was an XE adaptor board for connection to PBI enabled XE's, extra cost :-(

Thinking about it I am pretty sure is was a 6520 if used I would have liked it to be a 6522 for all the extra neat timers and things, still the circuit was not that difficult?

Hmmm Might dig it out and have a play....

Try Antic Magazine January-April 1985 inclusive for a four-part article entitled "The Parallel Bus Revealed" by Earl Rice (credited as being "one of Atari's former top technical executives").

Essentially, you can't "poke" the port--you have to hook up a device with its own ROM. The best bet for things like stepper motors is a 400 or an 800 because you have four joystick ports and easy access to all 16 data lines in the PIA. In any model, the PACTL2 and PBCTL2 lines are also available but you have to grab them off the SIO port.

John

Text mode consists of a matrix of 40x25 character cells. Each
character cell contains one of a possible 256 variations. The original
8x8 SAP description of each of the 256 variations are indirectly
described in a separate 2K region of memory. (Yikes. Is this
understandable?)

Guys,
Actually, DPI (dots per inch) is used for printers. This is how many
dots of ink you can fit in one inch of paper. LPI (lines per inch) is
the same but vertical measure. You normally don't measure a monitor by
DPI. .28 dot pitch is the number of phosphors in in inch across the
screen, and is a fixed amount. This doesn't change from a 14" monitor or
a 21" monitor. This means if the 21" monitor has a dot pitch of .28, it
will 'look' fuzzy compared to the 14" monitor at .28 dot pitch. Now, the
smaller the dot pitch, the more pixels the monitor can display. Like .2
is a finer dot pitch than .28 . Hense a higher resolution. If you are
looking for a large format monitor, choose one that has a very fine dot
pitch. It will match your graphics card's high resolution output better.
Resolution of your graphics board is how many pixels you can generate as
a bit pattern. You see 800x600x24BPP or 800 pixels across, 600 pixels
vertical and 24 bits per pixel of color information

The Atari 130XE and the two 1050 drives work great, no problems. The guy I bought the SupraDrive
from said that the drive worked, but would quit occasionally. So far, I guess I haven't tested it
enough to find the problem, since it's worked fine so far, but I can't guarantee it. However, I
have a name and email address for someone on the list who can repair it if there's a problem.

Included
Atari 130XE - power supply, tv adaptor cable, joystick
1050 Drives - power supplies, cables
SupraDrive - The drive itself, all cables, instructions, operating disk

I'm asking $130 US for it and I'll cover half the cost of the shipping. First person to contact me
through email gets it.

What John said &: You may want to use the joystick ports(JS). The JS are
done with a 6520 PIA so they don't have a lot of drive. Bit of RF filter
& protection added too. If you use both JS, you will have 8 bits of port
which should be enough for at least one stepper depending on the type.

You will want to buffer the JS port of course, & the most you can pull
is about 200 mamp so you will probably need to have a 2nd power supply
for the stepper.

The 6502 is slightly different in the Atari, IIRC, they tied the
register address lines in reverse so the ports are next to each other.
i.e. PORTA is $D300, PORTB is $D301, PACTL is $D302, PBCTL is $D303.

What does gg mean here?
> map = gg^AY

I probably could get it to work if I knew what ^Wt and ^Wb meant in
these macros:
> map L 80dd^WtGp=G&=^Wb79j&jL
> map <F1> :newI(0)^[:ce^WbggL
> map <F2> ^Wtggdd_:w! ~/work/oddZQgg_:w! ~/work/evenZQ

Windowing operations are normally preceded by ^W or :new but as I
said, I have a hard time understanding ^Wt and ^Wb. Logically, I would
assume that for Vim 3.0 it may be ^Wk and ^Wj respectively, assuming
that only two windows are open.

And another dumb question -- shouldn't :newI(0) be :new^V^V^V^MI(0) or
is that a different command that is not available in 3.0?

LPI is normally used for halftone screen resolution on printed matter. We print at 1200dpi with a halftone screen of 72lpi (which means 72 "clustered dot" patterns per vertical inch).

>.28 dot pitch is the number of phosphors in in inch across the

I think you typo'd a bit here. A 21" monitor at .28 dot pitch has way more rgb triads than a 14" monitor at .28, so the 14" will look much fuzzier.

Ooh ooh! Can I call that SIP and TIP? We need a few more TLA's here!
Being a commie, we already have FLI, FLD, VSP, MOB, VIC, SID, CIA, TED,
PET...now we can add SAP, MAP, SIP and TIP to the confusion! Yeehaw!

:)

Source record: 54667

Been there and done all that, I've had no problems using the js ports in the past. Just was wondering about the 'parallel' port. After examination of the pinouts, it looks like this port is just an extension of the cpu address, data, and signal lines. Kind of a rip-off.... shouldnt be termed parallel port at all really.
Thanks for all the info.

MM

Atari Connection Summer 1983 (these are hard to find - Atari 's own magazine)
Antic July 1983
Antic September 1983
Antic October 1983
Antic April 1986
Antic June 1987
Atari Explorer Jan/Feb 1989
Antic Explorer March/April 1989

Anybody want these? I'd prefer to sell them as a set.

If you're interested, make an offer, but keep shipping in mind - all together they are a bit heavy. All are in good to excellent condition.

> But they use Paddles, not driving controllers.

The free-spinning driving controllers looked exactly like the paddle
controllers. They were marketed with an early 2600 game Indy 500, where
multiple players drove around a loopy single screen track.

The controllers were designed for, and packaged with that cartridge. I do
not think any other game since was made to be played with those controllers.

In the last wave of atari carts (1987?) was a more advanced game resembling
Indy 500
but with a limited 3-D perspective, oil slicks, over/underpasses and what
have you. It was most excellent.

Right. But I thought the did bring out an external select line at $D100
which is really just another pin from their memory mapping chip. A small
matter to add a chip into the memory map there anyway.

What I used to do is just buy a 50 pin solder tail connector & some .100
spaced protoboard with edge connector. You just bend the solder tails
down so they contact the edge connector & solder away.

All of my junk was too ugly for words. I would add wire wrap pins blue
lines everywhere. I never really got the nack of doing it neatly.

2155. OMNIVIEW OS

Newsgroup: comp.sys.atari.8bit

Anyone have any info on the OMNIVIEW OS. I just got a 130XE with one in it.
This is OMNIVIEW, not OMNIMON. OMNIVIEW I think had an 80 column display,
provided cold boot by pressing help then reset, and reversed the
basic/option bootup sequence.
I just needed to know how to get the 80 columns to show and what other
features it has. I searched the web and came up empty.

Thanks.

2159. Connected but.. but the Modem Programs... Arrg!

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-18 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <36CC883F.39@geocities.com>
Source record: 54491

Thanks John for the message you sent me about how to make a Atari 850 interface cable. I got the 850 through port one talking to my Zoom fax 14.4k modem quite well.

Well, I say quite well.... here's the dirt now...

My Atari 400 (upgraded to 48K) is able to log on local bulletin boards through the 850 interface, port 1 to the Zoom 14.4K fax modem when I use the Telelink I cartridge. Beautiful... only problem is, it's moving at 300 buad.. possibly 1200 buad. (and yes, this BBS is from 1979 so it's tolerate of really slow speeds).

I then load up programs off disk... Bob Term, Term 850 (80 Column) and Express 850... all call up the BBS just fine, but then the communication stops. I am not able to get the BBS to see me, I cannot in turn see them, and after a few minutes the line is disconnected.

Alright, I would accept two solutions here.

A) Learn how to change buad settings with a AT command and
just use Telelink. Would be nice, crude and simple,
but if I'm at least able to move at 4800 buad, then cool.

B) Figure out what in the world is keeping disk based
programs on working through the 850.

Any ideas?

Thanks, Doctor Clu

2160. Re: Connected but.. but the Modem Programs... Arrg!

(asks at command to set modem speed)
I don't know about your cart program, how to set the computer
baud rate.
Bob Term you can set the baud rate of the computer.
So set Bob Term at 4800 and to set the modem at 4800,
ats37=8 and atn0 or ats37=8n0

Actually,

There are some very simple interfaces that convert from SIO to Centronic parallel, ICD made such cables and APE made them as well, they are fairly easy to build.

2162. Re: Diamond OS from Reeve Software ?

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-18 00:00:00 UTC
From: areeve@mindspring.com
Message-ID: <36cc9b90.1413359@news.mindspring.com>
Source record: 54494

Not too much software was written that took advantage of Diamond. Most
software loaded with a Diamond/SDX combo because we could kick the
cartridges out of memory, but so what...it loaded without the
cartridges period, too.

Atari talked to us in public about bundling, but that was just a PR
move to make it look like they cared about the 8-bit market. We even
gave Sig Hartman 5 samples at the WoA show in '88 never to hear
another word (and he tried to tell us that that was too many...guess
he knew nobody at Atari would want to take a look).

Anyhow, just filling in a bit more Diamond trivia. REEVEsoft is now
working on Windows software, but if you want to see the Antic cover
that Diamond was on it is available in the History section of our web
site at www.reevesoft.com.

8-Bits (demita@sprynet.com) wrote:
: I have an 800xl that boots fine to BASIC Ready prompt, but does not
: detect
: any game cartridges.

: I have cleaned all connector contacts and did continuity checks on all
: connector and board traces. These appear to match another 800xl I am
: using.

: Could there be a failing support chip that would not have an effect on
: the BASIC boot?

: Are there any diagnostic routines available for the 800XL?

: Thanks for any help - John

The cartridge port connects to the data bus, address bus (A0 to A12), +5V, gnd, R/W, B02, U2 (74LS138), and U3 (MMU CO61618). U2 and U3 might be possible support chips to suspect. Diagnostics is done with the SuperSALT cartridge and hardware tester - probably would cost more than the machine is worth. Make sure the cartridge connector itself is not at fault, or solder connections to it.

Steve

Moving around to different vantage points, even if only a few centimeters
between vantage point 1 and vantage point 2. Viewing familiar
objects such as buildings, TV, neighbouring house is cheating (sort of)
since your brain already knows their dimensions and can approximate the
location and dimensions of unfamiliar objects that overlap them.

How did this thread start anyways :-)

2176. cable for 850 interface to 9 pin connector

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-18 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <36CBB5CF.6C@geocities.com>
Source record: 54678

Alright you techies out there, I've been looking for it and I just can't find it. This is more a lesson in PC and standard serial ports for the PC than the Atari (since I have a gang-load of documentation for the Atari but not the PC...) :)

I'm working on making a 9 pin female (connecting to 850 inferface) to 9 pin female (zoom 14.4 fax modem) cable. What pins would I connect to what pins in this case.
Also, your suggestion for the proper connector port (1 through 4) will also be noted and appreciated. Just reply to this list and to me when you can.

FUN BACKGROUND...

I learned how to be a lightning fast typist on the Atari 400... currently working on setting up a Atari 400 once again to check bulletin board systems (while they are still there... or at least one in particular.)
I have a Atari 400, 850 interface, and Telelink cartridge, and a zoom fax modem. I figure a simple setup (didn't want to include disk drives in the mix for now).

Hey, here's a question... Express is in cartridge form now right? (I love cartridges, and I hate using disk drives when dealing with the 8-bit world. Had far too many go out on me.)

I hope to eventually even further simplify this setup by somehow replacing or adding a terminal program E-prom to the os board and add a serial port (Bob Wooley.. if you're reading this.. would love your support on this one.)

And hey, if anyone knows how to add E-proms to OS boards, I'm open for the advice, or.. I have a spare OS board that I could commission someone to work on. Hell... I have a spare 400... hehehe...

Love the 400's... my first computer, keyboard like none other. I think the words sturdy and cute best describe it.

Hey, look forwarded to hearing the pinout advice if someone could throw me a bone on that one, and all the other 400 crazyiness above.

Doctor Clu

clu-da-bard@geocities.com

/|\ It could be done on a PC... but why? :)

> address, data, and signal lines. Kind of a rip-off.... shouldnt be
termed
> parallel port at all really.

A parallel port just give you all you data/signals at the same time, which
is exactly what this port does.

Are you getting the term Parallel port (A General Term), confused with
centronics port(AKA Printer Port).

As you said in you origianl post;

> ... I think it was also referred
> to as the PBI (parallel bus interface).

See the word bus, I think that explains the function of this port quite
effectivly?

BTW I think "Best Electronics" are selling a experimenters kit for the PBI,
check out the theard "XL-Bus experimenter's Kit", I had one these kit's
once, I may give you the facilities you want.

2179. Atari Real Audio Show!!!

Newsgroup: comp.sys.atari.8bit

Friends and fellow Atari Enthusiasts:

It is my distinct pleasure to announce a new streaming Internet radio webcast dedicated to all things Atari. Back In Time ® The Radio Webcast has made its debut at http://www.emuclassics.com/backintime.

New episodes will be taped monthly. The show will feature news, reviews, and interviews. (Say that five times fast!) My guest for the first episode is the man STart magazine dubbed ®The Ultimate Atarian,® Donald A. Thomas Jr. Don will be discussing his days at Atari, the Tramiel family, the current state of classic gaming and computing, and Nuon.

The second episode will be posted in early March. Future episodes will feature many people from Atari®s past, including former Atari employees, hardware/software developers, etc. I will also feature the developers of current Jaguar/Lynx titles, and emulator authors that allow us to recreate the classic gaming and computing experience on the PC®s used today. Each episode will run for about 30 minutes.

To listen to the show, you will need a PC or Mac, and a copy of the Real Audio player. The Real Audio player is a free download from Real Networks. A link to download the player can be found on the Back In Time web site.

I'm interested in the 1200XL. I really don't need another 1050, and I may or may not have use for the books&disks, depending on what they are. Let me know what you want to get out of the 1200.

thanks,
KS

I had an Omniview XL which I eventually disposed of (incompatible with too
much software to make it useful and the GR8 screen was hard to read).
Anyway, I have the docs somewhere and will look for them. Since I don't
scan with my lowly 386, I'll type up a summary and post it with a direct
copy via email.

In the interim:

a. try Control-A and then Reset--I think that gets you into 80-column
mode;

b. at least with the XL version, the RD handler did not work correctly
with a 256k upgrade; and

c. I believe the beast was incompatible with SpartaDOS.

I have a file somewhere. As soon as I find it, I'll post it.

The 9-pin connector is the same for the P:R: Connection, the MIO, and the Black Box--it's almost but not quite RS232.

On the assumption that your printer is currently hooked up to a PC, the easiest way to interface the printer is to leave it on the PC and use SIO2PC or APE to connect the Atari and the PC.

If the Brother uses Hewlett-Packard PCL (Printer Control Language), you may experience some difficulty in writing a printer driver for AW. When AW was produced, the average printer used mostly two and three-byte control sequences but PCL is much more verbose. I found writing a PCL printer driver for PaperClip (about the same vintage as AW) to be a real challenge.

Really, really want an Atari 8-bit with some Demos such as the
Hobby-Tronic demo, and games like Mule, Rescue on Fractalus...

I'd prefer a matching system, such as 800XL with 1050, but any
solution will do, prefer the XL to the XE unless there were any 128K
only demos. I never had an XF551, so I'd like that setup :)

Obviously the tape drive would be nice too, to match the computer.

Money depends on system and what disks, tapes and cartridges are there
:)

TIA
Richard

No, the 2600 version was a much simplified version of the original
8bit game. I don't quite remember, I think it only used a few keys
on the keypad. The 800 computer version uses about 20 keys on the
keyboard with more detailed controls and options.

Wt and Wb mean top and bottom window respectively. They can be replaced with
^W^W.

> And another dumb question -- shouldn't :newI(0) be :new^V^V^V^MI(0) or
> is that a different command that is not available in 3.0?

The line should say :new^MI(0). Those sort of things must have been lost
through Usenet. Email me at the address below and I'll send you the fully
commented version UUencoded.

================================== Page 1 ==================================

NEW OMNIVIEW XL/XE FEATURES

OMNIVIEW XL/XE now have several new features which solve the
compatibility problem associated with the 800XL/130XE. OMNIVIEW XL/XE
does this by having an ultra compatible 400/800 style OS which will copy
itself into RAM, freeing up the $C000 page. In addition, OMNIVIEW XE has
resident ramdisk handlers which allow you to use the extra 64k of RAM in
the XE as an ultra fast disk drive. Add the other outstanding features
of OMNIVIEW XL/XE, namely, 80 column emulation under SpeedScript 80,
Letter/Data Perfect, BASIC, MAC65, ATR8000 CPM, rtc., and the Fastchip
floating point package for signifigantly faster math operations, and you
have an outstanding value for any 800XL/130XE owner!
```

Improved 400/800 compatibility:

(Developed by CAL COM, 5295 Cameron Drive #505, Buena Park, CA 90621)
The OMNIVIEW XL/XE operating system runs virtually every piece of software written for the ATARI computer. Besides being coded closely to the older OSB, it also has the capability of copying itself into RAM, freeing up the $C000 page for your applications. This means 4k more RAM for programs like Visicalc, modem programs, word processors, etc. It also means added compatibility with highly protected games which look for ROM in the $C000 page as a part of their misguided protection schemes (e.g. Electronic Arts).

To copy the OS into RAM (from $D800 tp $FFFF), hold down the SELECT key while pressing RESET. To restore the OS to ROM, press RESET by itself. From this point on, the RAM version of the OS will be preserved, even if you switch the OS to ROM and back to RAM. Thus, any changes you may make to the OS in RAM remain in effect as long as you do not power down. In addition, if you hold down the SELECT key during powerup, the OS will be copied into RAM and it will stay in RAM even if you press RESET. Please note that the 80 column emulation is not available when running the OS out of RAM.

There are two other features designed to give increased compatibility: the cursor speed and the OPTION key BASIC activation during powerup. The cursor speed is the same as the original XL/XE OS to remain compatible with the SYNAPSE software (SYNCALC, SYNFILE+, etc.) which speed up the cursor. Also, the meaning of the OPTION key during powerup is just opposite of the original OS: hold down the OPTION key to activate BASIC. This seems to be the preference of most people. In addition, there is the added function of the HELP key. Instead of using CTRL-1 the HELP key now functions as the scroll control for program listings.

Turning on 80 columns:

80 column emulation is activated fropm the keyboard by typing CTRL-a and hitting RESET. To return to 40 columns, type a key without CTRL and hit RESET. Don't try this if running OS in RAM. Also see "Technical Details".

Changing screen colors:

Switch the screen colors in the 80 column mode by holding down the START key while typing a letter. If this does not work (as in Letter Perfect), try holding down the START key while pressing RESET. However, since this combination is also used to install the ramdisk handlers, read the next section before using this second technique.

Installing the resident Ramdisk handlers: (130XE only)

The resident Ramdisk handlers in OMNIVIEW XL/XE allow you to use the extra 64k RAM of the 130XE as an ultra fast 512 sector single density disk drive in conjunction with any DOS which uses standard SIO calls

($E459 and $E453) and does not hide itself underneath the cartridge or OS (e.g. Atari 2.0s, MYDOS, SMARTDOS, etc.). In addition, you will find it possible to use the Ramdisk with boot programs like Letter and Data Perfect.

The installation is simple: Type a number (1 to 8) corresponding to the drive number you wish to assign the Ramdisk, hold down the START key, and press RESET. (Note: If you are using DOS 2.0 and it is not configured for more than 2 drives, it will be necessary to configure it accordingly. First boot up BASIC with DOS 2.0, then, after you have a `Ready' prompt type `POKE 1802,15 for 4 drives or `POKE 1802,131' for 8 drives. Now go to DOS, write the DOS files back out to the disk. You have now configured DOS to accept either 4 or 8 drives online.) Continue to hold the START button down until DOS returns or you go into BASIC. The reason for this is to allow the ramdisk handler enough time for the installation process. If you do not hit a number prior to pressing START/RESET, drive 1 will be assumed. In Letter/Data Perfect this combination is also used to change the screen colors, so assign the Ramdisk as drive 3 if you do not wish to use it in these environments. For example, in BASIC:
1) Type DOS to go to DOS. Now type 2 and START/RESET to install the Ramdisk as drive 2.
2) Since you are now back in BASIC, go to DOS again, format and write DOS files to drive 2. (Note that we suggest doing a directory on the drive # you have assigned the ramdisk to. This is to show the DOS that the drive exists)
3) Now type 1 and START/RESET to install the Ramdisk as drive 1 if you so desire.

You can use the enclosed files on the SpeedScript 80 diskette to install the ram disk handlers. The files named INSTALL1 and INSTALL2 are the ramdisk installation files. To use them simply load them from DOS depending on

which drive you wish to assign the ramdisk. You will still have to format the disk you have assigned to be the ramdisk. Again we suggest doing a directory on the drive number the ramdisk has been assigned.

To create your own file in assembly language type as follows:

```
LDA #2 (the 2 denotes the drive number, this can be changed)
STA $94
LDA $D301
AND #$7F
STA $D301

The Overview of OMNIVIEW XL/XE

OMNIVIEW XL/XE takes advantage of the high resolution graphics mode built into the ATARI to grenerate an 80 column screen editor essentially identical to the ATARI screen editor (E:, S:). Thus, you can use OMNIVIEW XL/XE in any environment where you would normally use the 40 column "E:" (e.g., BASIC, Assembler/Editor, Mac/65, BASIC XL, modem programs, etc.). The character font was specially designed to be legible on an ordinary TV set! A monochrome monitor is recommended, but not really necessary for casual 80 column operation. The Bit-3 versions of LJK's Letter and Data Perfect have been modified to support OMNIVIEW XL/XE, along with SpeedScript 80. Other programs are very likely to follow once software developers realize the potential of the OMNIVIEW XL/XE.

Use of OMNIVIEW XL/XE 80 column E:

You can activate the 80 column mode in most environments (e.g. BASIC, DOS, etc.) by hitting CONTROL a-RESET. This will do a normal warmstart except that 40 column E: and S: will be replaced by 80 column E: and S:. In addition, the 80 column mode can be activated from assembly language with `JSR C001' or from BASIC with `X=USR(49152)'. Once activated, the 80 column E: acts just like the ATARI 40 column E: except for a few minor points. First, the logical line is 80 characters long (1 physical line) instead of 120. If you wish to edit a line longer than 80 characters, as you might in BASIC, hit SYSTEM RESET to take you back to 40 column mode. Secondly, you cannot set the tabs as you can in 40 column mode. Thirdly, neither split screen nor

line drawing is supported. However, there is a feature which will allow a mixture of 80 column text and graphics on the screen. This will be described later.

Thus, any program which uses pure E: in its simplest form (no split screen or line drawing) for its screen I/O should work in 80 column mode. Even programs which reference and manipulate internal E: variables (ROWCRS, COLCRS, LMARGN, RMARGN, OLDCHR, etc.) should work fine because every effort was made to preserve the meanings of these variables in 80 column mode. One possible exception would be a program which relies on characteristics specific to a 40 column screen like, for instance, that the line will wrap at the 40th column. Likewise, programs like VISICALC, ATARIWRITER, MEDIT, etc. will not work because their internal design assumes a 40 column screen.

Theory Behind OMNIVIEW XL/XE

OMNIVIEW XL/XE uses ANTIC mode F (BASIC GRAPHICS 8), which gives you a resolution of 320 by 192 pixels. If you use a 4 by 8 character cell, this gives you exactly 80 columns by 24 rows. One drawback to this

scheme is that it uses $1E00 bytes (almost 8k) of memory for the screen data alone. This is rarely a problem and, when it is, you can always drop into the 40 column mode anyway. Another drawback is that the format of the screen data is not nearly so convenient as BASIC GRAPHIC 0 (which is essentially stored as ATASCII). Each character must ve translated to pixel data represented by bits in noncontiguous bytes in screen memory. This gets especially tricky when E: goes to read a character from the screen! This requires a search of the character data table to find a match for the pixel data representing that character. You can see how this could be quite slow, but this part of the code has been optimized for speed and the small delay is hardly noticable. For example, it will take a fraction of a second longer for the machine to respond when you type a line of BASIC and hit RETURN.

Technical Details

When you activate 80 column mode with CNTRL-a/RESET, `JSR $C001', or `X=USR(49152)', OMNIVIEW XL/XE initializes the 80 column screen and installs the 80 column E: and S: in the handler address of the table at $31A (HATABS). Afterwards, all CIO calls to E: and S: will get vectored into OMNIVIEW XL/XE. By the way, when OMNIVIEW's E: GET CHAR routine fetches a character from the keyboard, it vectors through the K: entry in HATABS instead of cheating like the OS does and calling the keyboard handler directly. This would allow you to redirect the keyboard input if you so desire.

As mentioned earlier, there is a way to mix 80 column text and graphics on the same screen. While the first line of text is always the top row, the last is set with the variable BOTSCR ($2BF), which ranges from 0 to 23. If you were to set BOTSCR to anything less than 23 then you could use the remaining lower part of the screen for anything you wanted by simply modifying the display list. Also, since OMNIVIEW uses graphics 8 to generate the 80 column characters, there is nothing to keep you from drawing on the screen directly. This opens up all sorts of exciting possibilities which were inconceivable with the other dedicated 80 column boards for thje ATARI. For example, wouldn't it be nice to have a word processor which would allow you to draw diagrams in with the text? Some software developer ought to jump on that one and incorporate that into the enclosed 80 column version of SpeedScript 80 the comes with the OMNIVIEW XL/XE at no charge. Contact CDY for the source code for SpeedScript 80.

Here is a memory map of the screen data area:

RAMTOP*256 ->RAMTOP HOLDS THE NUMBER OF PAGES OF RAM
RAMTOP*256-$126 ->FUTURE BUFFER FOR LAST LINE DELETED (LINBUF)
RAMTOP*256-$1F0 ->BEGINNING OF DISPLAY LIST
RAMTOP*256-$1FF0 ->BEGINNING OF DISPLAY DATA (SAVMSC)

RAMTOP*256-$2001 ->LAST BYTE OF FREE RAM (MEMTOP)

Here are the definitions of OMNIVIEW XL/XE variables:

DSTAT $4C USED TO SAVE STATUS
TEMP $50 TEMPORARY REGISTER
HOLD1 $51 TEMPORARY REGISTER
LMARGN $52 LEFT MARGIN (0-79)
RMARGN $53 RIGHT MARGIN (0-79)
ROWCRS $54 ROW CURSOR IS ON (0-23)
COLCRS $55 COLUMN CURSOR IS ON (0-79); DISCERNS BETWEEN ODD
AND EVEN CHARS DURING SCREEN OUTPUT (OUTCHJ)
LFTMSK $56 INVERSE VIDEO MASK FOR EVEN COLUMNS
RGTMSK $57 INVERSE VIDEO MASK FOR ODD COLUMNS
SAVMSC $58 2 BYTE POINTER TO BEGINNING OF DISPLAY DATA
OLDCHR $5D INTERNAL FORMAT OF CHARACTER UNDER CURSOR
OLDADR $5E 2 BYTE POINTER TO CURRENT CURSOR POSITION (ALSO
SEE COLCRS) WITHIN SCREEN DATA
ADRESS $64 2 BYTE POINTER TO CURRENT CHARACTER
MLTEMP $66 2 BYTE POINTER WHERE NEXT CHAR WILL BE OUTPUT
(ALSO SEE COLCRS) WITHIN SCREEN DATA
RAMTOP $6A NUMBER OF 256 BYTE PAGES OF RAM AVAILABLE
BUFCNT $6B BUFFER COUNT DURING E: GET CHAR
BUFSTR $6C RETAINS START OF LOGICAL LINE DURING E: GET CHAR
(ROW/COL)
DILIST $70 TEMP 2 BYTE PTR USED DURING GENERATION OF DISPLAY
LIST
TEMP1 $79 TEMPORARY REGISTER
INSDAT $7D TEMPORARY REGISTER
LINBUF $7E 2 BYTE POINTER TO A LINE BUFFER JUST PAST DISPLAY LIST
GPRIOR $26F PRIORITY SELECTION REGISTER
HOLD3 $29D TEMPORARY REGISTER
ESCFLG $2A2 ESCAPE FLAG; USED TO DISPLAY CTRL CODES
TMPROW $2B8 TEMPORARY STORAGE FOR ROWCRS
SCRFLG $2BB SCROLL FLAG; SET IF SCROLL OCCURRED
SHFLOK $2BE FLAG FOR SHIFT AND CONTROL KEYS
BOTSCR $2BF THE NUMBER OF TEXT ROWS AVAILABLE FOR PRINTING
MEMTOP $2E5 2 BYTE POINTER TO THE TOP OF FREE MEMORY
CRSINH $2F0 CURSOR INHIBIT FLAG; NON-ZERO TURNS CURSOR OFF
ATACHR $2FB LAST ATASCII CHARACTER READ OR WRITTEN
CH $2FC INTERNAL HARDWARE VALUE OF THE LAST KEY PRESSED
DSPFLG $2FE DISPLAY FLAG; NON-ZERO WILL DISPLAY CTRL CHARS
SSFLAG $2FF START/STOP FLAG; NON-ZERO WILL SUSPEND SCREEN
OUTPUT

Use of OMNIVIEW XL/XE WITH LJK'S Letter Perfect

Any version of Letter Perfect which supports the Bit-3 board can, with
the appropriate patches, be made to work with OMNIVIEW XL/XE. Some
special fixed entry points were added to OMNIVIEW XE/XL to provide the

necessary hooks and these can be used in your own software if needed:

CURSNJ $CFB1 TURN ON CURSOR @OLDADR ($5E)
CURSFJ $CFB4 TURN OFF CURSOR @OLDADR ($5E)
DELRTJ $CFB7 CLEAR TO EOL, BASED UPON MLTEMP ($66) AND COL # IN REG Y
OUTCHJ $CFBA OUTPUT CHAR IN ACC TO SCREEN @MLTEMP ($66) AND COLCRS ($55)
SCROLJ $CFBD SCROLL SCREEN UP
SCRLDJ $CFC0 SCROLL SCREEN DOWN

I have a 400 with a 32k board that didn't need any jumpers. Just a
board swap.

If the printer has a centronics interface, it might work with any of the many printer interfaces for Atari 8 bits. At www.myatari.com where B&C resides, they list quite a few. I think Epson has been pretty good about keeping their new printers downward compatible with the old escape codes. Someone correct me if I'm wrong here. The only drawback I would see is that you'd be stuck with the low resolution of the old software.
For programmers, the ability of any printer to print the ATASCII character set is a big plus. I remember "lister" programs for Epson and Star printers that would allow this.

>

Yes... I had one too... Axlon 32k board... didn't require jumpers as the Atari
48k .. Anyone know why?????? And.. I still belive there is a way of modifying
the new Atari 48k board (which is actually 64k) to access the extra 16k...
David Byrd, Jay Torres, Claus Bucholz all made boards out of 16k boards, that
were Axlon compatable....

Hmmm

You folks are talking about other
keyboards connecting to 8bit. I know
a guy who uses the keyboard of an
atari 600xl (the case of the 600xl =
the whole keyboard) with an 25 pin
connector and cable... it rulezzz.

Btw, I guess the original atari 800xl
keyboard qualitiy is the best ever
made. Most of my 800 xl computers are
with these nice "klik klik klik"
technology and I wished my PC had an
800xl keyboard.

Greetz,

>PC keyboards are superior on XE

Big mistake :-)

With a PC-keyboard connected (using an interface) to the Atari 8-Bit, you
cannot emulate some of the key-presses, like the RESET-SELECT combo would
not work, since they are both F?-Keys on the PC keyboard, and they can't
be read-out exactly at the same time...
The only way to perfectly use a PC-keyboard onto an Atari 8-bit would be
to completely rewire the thing. A hell of a job! I'm busy to connect an
Atari-ST keyboard that way!

Another nasty problem is, when software asks for keyinputs like "Shift-3",
or "Shift-Control-7"...

The shift-8 is actually an "@" on 8-bit, but "*" on a PC keyboard.
Imagine what happens when asked to press "Shift-Control-7" :-)

2203. Elite - the unfinished project.

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-19 00:00:00 UTC
From: Gareth <dial.pipex.com_.nospam@garethd.com>
Message-ID: <7akqf0dpi1@plug.news.pipex.net>
Source record: 54519

I was reading an old copy of the UK mag "Atari User" yesterday (one of the few I didn't through out). Anyway, it mentioned that Elite (the fantastic BBC/CBM/Spectrum game) had not only been planned for conversion to XL but that work had actually started on it and progressed to about 50%. There was no explanation as to why the project was dropped.

Does anyone know what actually happened - why the coders stopped? It would be interesting to know what exactly happened because I think that whatever it was it was part of the wider problem of the Atari 8 bit death - many popular progs on the CBM never made it to Atari and there seemed to be a watershed around 1985/86 where, despite a large user base (in the US anyway), developers lost interest in Atari 8 bit. A similar thing happened with the ST yet not with the Amiga. For what it's worth I remember reading an interview with Jeff Minter - which damaged my perception of his programming skills - where he said that Revenge of the Mutant Camels would never make it to Atari because of hardware limitations: like of "sprites" compared to C64 and no multi-colour graphics (or something like that).

Gareth.

I guess I've said this a million times before. Keyboards are a very subjective thing. My 800's keyboard was definitely superior to any of the XLs or XEs I've owned. I've heard that XEs (or their equivalent) sold in Europe have better keyboards than those sold in the US. I put one of those Best XE Touch kits in mine, and it helps a little.

I use a Focus 2001 keyboard with my PC. It originally came with a '286 system that I had, but I liked it so much that when I donated that '286 and got my current system, I put the new keyboard (a piece of junk) with the old machine. The Focus is clicky it's almost as good as the 800's keyboard!

>Atari-ST keyboard that way!

Most (since the last years all) of the pc keyboards have an ghosting software algorithm to detect more than one keypress at the same time. This algorithm can detect exactly 3 (of 4 in a matrix) separated keys. The keyboard sends an "make code" for every keypressing and an "break code" for every keyrelease. The pc doesn't interpret several keys at one time (exc. SH,ALT,CTRL.... etc), but it can be done. More than two keys doesnt work correct on some pc keyboards, but work on most !!. This depends on the position of the keys in the matrix scan lines. Keys in same rows or same columns cant only be read under special circumstances.

See the Application notes from Motorola and National Semiconductor, theres an exact description of this problem. (links on my HP see under AKI).

With my AKI Interface you have no problems on emulating START+RESET,
SELECT+RESET or OPTION + RESET combo.
I dont know the way TRANSKEY does.

>Another nasty problem is, when software asks for keyinputs like "Shift-3",
>or "Shift-Control-7"...
>
>The shift-8 is actually an "@" on 8-bit, but "*" on a PC keyboard.
>Imagine what happens when asked to press "Shift-Control-7" :-)

:-)))) nasty problem... Let me say press @ on pc (for sh-8). ;-) yes, i know, theres no good working emulating solution for this.

But look at the atari software. The software doesnt use the ATARI keyboard handler "K:" and the standard os routines. It isnt a good programmers style. I think theres no standard ATARI-software wich has this problem...

Most programs for the ATARI are written in a bad style. Therefore its also very hard to make some new hardware or new device drivers. All these old stupid disks must run with it. (:-) some years ago i was also one of these stupid programmes wich thaught they write very cool). Some of the greatest programmers failures are done on the following :

- switching ramdisk
- using OS routines without jumptables
- using illegal opcodes
- peek and poke in IO chips without using shadowregs
- speed up disk drives (serial io)
- fixed IOCB numbering/accessing

ok i will end, think its off-topic.

For more infos on AKI - Atari-Keyboard Interface (and the links for the pc-keyboard application notes) see:

http://members.aol.com/MacFalkner

bye, MacFalkner.

Huh??? I have an 800XL with the better keyboard and it isn't all that
hot. The 1200XL and the 800 weren't bad, but compared to my genuine
IBM keyboard on my PC.. well there is no comparison really. I do
realize that a lot of today's PC keyboards are the mushy things. Some
people don't like mushy (me included).

Fraid it IS something were the C64 had an edge, a friend was working on
the conversion of Green Beret to the Atari, it almost got canned because
of things like the game character had combat trousers (green / black)
and they had used pretty much all sprites elsewhere.

If you look at many platform games you will notice the main person is
very few colours.

Can't answer re Elite, glad to see someone reading the old Atari Users,
mine all went in the bin except the ones I'm in :)

> be read-out exactly at the same time...

Yes they can. :-) The PC keyboard interface is serial and transmits
key-up and key-down (make/break) codes. It's simply a matter of software
to determine which keys are pressed. W/ the correct software you can
tell if any keys are pressed together or held down, or even if ALL the keys
held down. You basically just maintain a keystate map.

The Atari uses a simple 8x9 scanning keyboard circuit, so on that side you have
to present grounds for the corresponding row/column of the Atari keyboard,
in relation to your PC keystate map.

> The only way to perfectly use a PC-keyboard onto an Atari 8-bit would be
> to completely rewire the thing. A hell of a job! I'm busy to connect an
> Atari-ST keyboard that way!

You have to wire up all the 4051 inputs, and the POKEY scan counter output

The Atari function keys are not parts of the keyboard scan circuit, so each one
requires its own open drain input to simulate keypresses.

Wired correctly it will allow the Atari keyboard to function in cooperation
w/ the PC keyboard so either can be used at the same time.

> The shift-8 is actually an "@" on 8-bit, but "*" on a PC keyboard.
> Imagine what happens when asked to press "Shift-Control-7" :-)

Again easy enough in software. Your just doing in firmware what the
Atari emulators already do, remapping the keyboard. Not too tough a task
since your already translating the totally alien IBM keyboard protocol.

A < 1Mhz 6507 w/ a RIOT can handle scanning a PC keyboard and and emulating
the Atari scan circuit. Its a fun project, really <grin>.

Easy solution in Atari 8bit! Just put a Display List Interrupt in the correct
place changing all the information of a Player Missile. That way you can display
twice (or more if you want) each player missile.
I've seen it working, and a friend of mine made a demo using that "feature".

Saludos!

That may be, but I think the excruciatingly bad terminology has a lot
more to do with it.

>that's highly mutable. Trust me, the use of the term pixel to describe
>the smallest addressable element in any given resolution is... well,
>the very definition of "pixel"! (And yes, it is a contraction of "Picture
>Element").

I decided to take my own advice, and ask around -- scientists,
electrical engineers, etc. -- as to what they thought a pixel was.
Most came back with a "phosphor dot" definition. The IR sensor
guys use it to talk about the resolution of their sensor -- no
computers or monitors at all! A few came back with a discussion
of information content -- that a single pixel might have 8 or 24 bits
behind it, etc.

Then I explained the Atari constructions, and the idea of doubling
pixel widths, and other such interesting phrases, and to a man they
thought I was nuts (or that you guys were nuts :).

Which brings me back to my original point: there probably isn't any
official definition of "pixel", but the Atari use of the term is
fairly different than the more commonly understood definitions.

"It depends on what the meaning of the word 'pixel' is"
"I did not use a pixel as I understand the term."

Maybe you can repeat my test -- ask a bunch of electrical engineers
what they think a pixel is, and see what they say.

>> It's only on the Atari that you can get strange sentences like
>> "screen size is 40 pixels by 24 pixels" and "register x will change
>> the width of the pixels."
>
>And in this obscure OS I'm currently using. "Windows" or something like
>that...

Your windows manual tells you how to get a 40 pixel by 24 pixel
display, or contains sentences like "set x to change the width of
the pixel"? I highly doubt that, and sarcasm certainly doesn't
make it more convincing.

The key part in the first quote is the 40x24 -- your Atari generates
a lot more than 40 phosphor dots horizontally; related to the second
quote, each of those "computer addressable points" is an 8x8 block
of pixels, not a "pixel of different width".

When you change from a high resolution in Windows to a lower one,
are there the same number of pixels (i.e. phosphor dots) on the
screen, so that the low-res points are a little block of multiple hi-res
points? Or is there actually a different number of pixels (phosphor
dots) on the screen? It is a serious question, which I don't know the
answer to, but since the monitor probably changes frequencies when you
change resolutions, I suspect the latter -- which would be very different
than what the Atari does when you change resolutions.

The real funny thing about all the hardware wars is the commie people
just don't know how to make us feel bad. Not like a real Atari wag could
after years of practice dealing with Atari Corpse.

Typically, their arguments tend to the price poorformance of a C64 which
came out 3 years after the Atari home computers. Computer years are like
dog years, 3 years after & still being comparable is a losing argument.

What they should do is focus on the big failures i.e.
"Ha! The 1200xl came out a year after the C64, 14k of unusable ram,
incompatible, MSRP or $799.95, poor video output, and the SIO port
wouldn't even support SIO powered devices w/o being modified! Sure, nice
keyboard, but you guys paid an extra $600 for a keyboard & 14k less
ram!"

That being said, 1200XLs that have been Wooleyised are my favorite 8 bit
computer. Soon as you turn them into an 800XL, they are great.

For some reason I have had some bad luck getting back into the Atari fray.

Left one 256k 1200XL on overnight, figured it would get rid of any condensation after having not been fired up in several years. While I was just puttering around the house I got the sound like the engines in Star Raiders. Yeap, Pokey went out just sitting there turned on, but I had a spare or two.

So decided to take a look at another one that I had found in a surplus shop for $2.99 that originally only needed the 6520 replaced to get the JS working again: Black Screen of Death. Swapped out every LSI chip in the thing, then finally found a bad RAM chip.

Which brings me too; Decided to take a quick look at what happens in the absence of a LSI chip. Seemed like a good idea at the time, not so sure in retrospect.

For a 1200XL
Anyway, pull a Pokey & boot the computer, boots normally with blue screen but no booting sound.

Pull PIA & boots normally with only the keyboards LEDs not functioning.

Pull an OS chip, GTIA, ANTIC, & black screen. The ANTIC did produce different glitches then the OS or GTIA. Just some flashes of distortion on the screen when the computer is first turned on, but you would really need to be practiced to guess which is gone in a blind test.

Pull a DRAM & either got a black screen or a solid color, mostly black on boot.

>location and dimensions of unfamiliar objects that overlap them.

Well, I once again suggest a variation of my earlier experiment:
close one eye. Walk into an unfamiliar room. Try to make baskets
in the trash can.

I have tried this; I could make baskets.

I also offer the following experiment: close one eye. Hold a finger
close to your eye, and focus on it. Remove your finger, and focus
on an object behind your finger.

The fact that you have to refocus at all suggests to me that you have
a mechanism for judging distance (not to mention that the eye
and particularly the eye/brain relatinship is very complex!).

>How did this thread start anyways :-)

The usual -- by me :).

I'll concede that the brain can do some amount of distance judging via focus... but... that method does not work as well as binocular vision in that application. The focus method falls apart when the distance involved is beyond depth of field considerations. What I mean is, after a relatively short distance everything is focused at the same focal adjustment. If you've ever used a nice camera which allowed manual focus (or binoculars or a telescope) you will notice that anything beyond a certain distance is in focus at the same focal setting. Point that camera at a person 6 feet away and focus. The person is in focus but the wall 6 feet behind the person is not. Focus at a distant lighthouse on a well moonlit night. Without readjusting the focus (which should be at the infinity mark anyway) point the camera at the moon. The moon is in just as good of focus. No refocusing took place. Same with you eyes. No refocusing, no ability to judge a difference in distance with your "focus" method.

Also, to whoever said that using one eye, look at something, move and then look at it again and have the brain computer the distance with triangulation.... nice try buddy. It doesn't work that way. At least not to any significant accuracy. Your brain puts it together based on the information from two eyes getting simultaneous stimulus. The only way your brain puts it together by moving to different spots is when you think in a disciplined mathematical way and probably need help from a calculator or scratch paper. It isn't easily automatically computed by the subconscious.

A "pixel" is a "picture element" and is the smallest unit comprising a graphical image. The TRUTH about the word is that it is not locked into one specific technology. Like many words, its basic meaning (as it relates to a specific frame of reference) can have differing applications depending on the context it is used. An exagerated example of another such word would be "BUTT." Butt is generaly understood to be the rear, bottom, or last of something, rather than the front, top or first. You can have the butt of a gun which is certainly different than the butt you are probably sitting on right now. You can be the butt of a joke (meaning you are probably the last one to gain anything posative from it).

Likewise, "pixel" can also be different things depending on context. Its basic definition stays the same but it gets different appended or expanded definitions depending on how it's used. Both the "phosphor dot" and the smallest addressable position in an image held in software are actually correct. There are probably other "correct" uses of the word as well. Of course the answer you're going to get if you ask a bunch of folks who do not design electronic graphical images (like a graphic artist using a computer) but DO look at graphical images displayed on CRTs, is an answer of the phosphor dot. If you ask the designer of say a 3D rendering application what a pixel is he'll probably tell you it is the smallest unit of an image regardless of what type of display it may eventually get displayed on. Whether it gets displayed on some horribly low resolution TV, or the finest state of the art 100 inch .14 dot pitch monitor, his image resolution in software does not change; ie. HIS "pixels" do not change.

Can't we all just get along?

Hehe.

The manuals on later HP deskjets do not even list the codes. If you want
them, they are downloadable from HP's site, but be prepared to use tons of
paper to print them out! I can see where devising an Atari printer driver
for these beasts means leaving out lots of the printers' features.

2226. OS ROM images for 1200XL

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-20 00:00:00 UTC
From: Benjamin Matthew West <bmw3@cec.wustl.edu>
Message-ID: <Pine.SOL.3.96.990220235213.14541A-100000@ritz.cec.wustl.edu>
Source record: 54592

As part of my attempt to resurrect an old 1200XL, I would like to burn two 27128 EPROM's with the original 1200XL OS data. Does anyone know where I could find ASCII text versions of the OS ROM images? That is, I'm looking for the binary/hex/decimal listing of the OS in ASCII text, and not in a proprietary binary format.

Thank You.

>I think Epson has been pretty good about keeping their new
>printers downward compatible with the old escape codes.

Check hard into this. I've wanted to upgrade
for a while - I use a HP DeskJet 500, and the
only way that I can use it very effectively is
with the Epson FX 80 emulation cartridge.
When I have asked about more modern
printers, including Epson's, I've been told
they have all gone to HP emulation. I have
not been able to go through manuals, but I've
been told by enough different people that I
believe it. You might try looking around the
web for an Epson site.

How complete is this set? all? 50 issues, 100 issues? I'll offer 50 cents an issue + shipping at usps book rate.

I read that just the other day at www.atarihistory.com. 75 complete
systems, 8 of them TONG motherboards, and I believe 150 cases. Of
course, I forgot to bookmark the actual page, and when I went looking
just now I couldn't find the reference. DOH! Oh well.

The back of the cartridge says it best I think...

You control "Bounty Bob" as he climbs ladders and walks on the framework. Use the special equipment like the transporters the lift, and the cannon to help Bob claim the mine. Collect the various possessions left by previous explorers but watch out for mutant organisms that lurk everywhere and try to waste you.

... all and all, great game, great controls, it was one of the first games that sold me on getting an Atari 400.

I understand there is a sequel.. Bounty Bob Strikes Back.. would love to try it someday.

Doctor Clu

Here's the definition of PIXEL according to the Reader's Digest
Illustrated Encyclopedic Dictionary (cc1987).

PIXEL n. An element of a computer graphics display on a video terminal

And here's the definition according to Desktop Publishing by Design (published by Microsoft Press):

PIXEL The smallest dot or unit on a computer screen. The clarity of screen resolution varies depending on the number of pixels per inch on the monitor.

And here's a lengthy explaination from an old Time-Life book series on computers (copyright date not given but probably around 1983 considering the primitiveness of the computer graphics):

Located at the narrow end of a color CRT are three electron guns, one each for the colors red, green and blue The guns themselves fire colorless beams of electrons; a yoke of electromagnets encircling the tube causes the three beams to scan the screen in unison, striking, respectively, the red, green and blue phosphors that together make up a single dotlike picture element, or pixel. A color screen contains hundreds of thousands of these phosphors arranged in vertical columns and horizontal rows. As the beams approach the screen, they converge at a mask-a thin sheet of metal punctured with microscopic holes-which blocks stray electrons that would otherwise blur the image. When the beams strike the phosphors in each PIXEL, the chemicals emit red, blue or green light, which the human eye interprets as a variety of colors, depending on the intensity of each beam.

And, finally, here's the definition according to a book called Inside the Apple IIGS (cc 1987):

A PIXEL is the smallest unit that can be displayed on a graphics screen. In the Hi, Double Hi-, and Super Hi-Res modes, pixels are visible as tiny dots. In the lower-resolution modes, the block is the smallest display unit.

If I had the desire to go up in the exceedingly cold attic I could find a couple dozen other definitions for a pixel (including those found in Atari specific books). As you can see, the definition is not entirely static.

>Then I explained the Atari constructions, and the idea of doubling
>pixel widths, and other such interesting phrases, and to a man they
>thought I was nuts (or that you guys were nuts :).

Atari owners are a rare breed (ie. nuts). On a more serious note, there are problems with your above remark. First, you assume that the person (or persons) were knowledgeable in computer graphics and, second, that you were able to properly explain the concepts underlying our definitions.

>Which brings me back to my original point: there probably isn't any
>official definition of "pixel", but the Atari use of the term is
>fairly different than the more commonly understood definitions.

Which commonly understood definitions are you referring to?

>"It depends on what the meaning of the word 'pixel' is"
>"I did not use a pixel as I understand the term."
>
>Maybe you can repeat my test -- ask a bunch of electrical engineers
>what they think a pixel is, and see what they say.

From what I've experienced, the definition of PIXEL is dependent on the knowledge of the person asked. All electrical engineers know the basic underlying principles of electric circuits (I hope) but this doesn't mean they have any understanding of CRT repair, computer programming, machine language, video display hardware, Ataris, and PIXELS.

>>> It's only on the Atari that you can get strange sentences like
>>> "screen size is 40 pixels by 24 pixels" and "register x will change
>>> the width of the pixels."

Such resolutions were common on extremely old computers. Nowadays (on PC compatibles), we have screen sizes of 640 pixels by 480 pixels, 800 pixels by 600 pixels, 1024 pixels by 768 pixels & 1280 pixels by 1024 pixels.

>>And in this obscure OS I'm currently using. "Windows" or something like
>>that...
>
>Your windows manual tells you how to get a 40 pixel by 24 pixel
>display, or contains sentences like "set x to change the width of
>the pixel"? I highly doubt that, and sarcasm certainly doesn't
>make it more convincing.

Microsoft Windows relies on the most generic & primitive video hardware standards of the PC. The whole concept of "mixing resolutions" is alien to Windows (and the huge majority of PC programmers). Heck, even the Amiga's ability for separate SCREENS are alien to PC users. And don't even mention SPRITES.

>The key part in the first quote is the 40x24 -- your Atari generates
>a lot more than 40 phosphor dots horizontally; related to the second
>quote, each of those "computer addressable points" is an 8x8 block

>dots) on the screen? It is a serious question, which I don't know the
>answer to, but since the monitor probably changes frequencies when you
>change resolutions, I suspect the latter -- which would be very different
>than what the Atari does when you change resolutions.
>
>-Steve

The number of phosphor dots that a specific monitor supports is fixed by that monitor (and is dependent on the size and dot pitch in milimeters). The number of separately addressable pixels is fixed by the video hardware inside one's computer. Video computer hardware usually has the flexibility of supporting a number of different resolutions (ie. 640x480 pixels or 1024x768 pixels) but the fineness of the monitor's phosphors may not be equal to the higher resolutions and, thus, the display will look blurry.

A question about emulators (since I rarely
use one). ALL BBSB ATR's that I have
found run only on PAL machines. (May
run on the Nir PAL upgrade, but I haven't
done that yet.) I've also heard that one
or more of the emulators can emulate
a PAL machine on an (NTSC) PC. (?)
Anyone tried BBSB, assuming that this
is true? Note that BBSB was an NTSC
game, but whoever made the ATR's put
intro code that goes off into PAL land
and stops dead on an NTSC machine.

How (specifically) does the Atari
know what the drive number is
of devices on the bus? Presumably
most everyone has heard the soiunds
of 2 drives with the same number trying
to respond at the same time.
My presumption is that the CPU sends
out a command for a particular drive
that designates some code for drive #_,
and then drive #_ responds with the same
code. And this is controlled by the setting
of dip/slide switches on the drive. Can anyone
shed some light on this?

Hi!

A PC can't be PAL nor NTSC. That has no sense, unless you have a Video card on
it interfacing with a TV system.

The emulator "Atari 800 for windows" has options to configure your "hardware" at
demand; 400, 800, 600XL, 800XL, etc., and PAL or NTSC. Try it!

: Text mode consists of a matrix of 40x25 character cells. Each
: character cell contains one of a possible 256 variations. The original
: 8x8 SAP description of each of the 256 variations are indirectly
: described in a separate 2K region of memory. (Yikes. Is this
: understandable?)

Okay, so we'll expand the use of SAP to include an optional
"embedded sub-SAP". SO our original 40x25 SAP for char-mode
gets rewritten as 40x25 SAP(256 PGE-320x200 SUS).
PGE=Predefined Graphic Element
SUS=SUb Sap
Meaning that the char-mode, while having only 40x25 SAP,
each SAP can hold one of 256 PGE which appear visually as a
part of a 320x200 SAP - because the PGE can be placed anywhere
in the 40x25 matrix and would look as if it was part of a
320x200 SAP. Note that placement in the SAP modifier (...)
is recursive. Mostly.

Hey, that would be great. I most certainly would appreciate that.
I am not sure I got your address correct or not. I'll find out
shortly, though. Anyway, just send it to my "Reply-To: " address.

Usenet does tear up control codes. I think I got a fair reading,
though, since I am using VIM to read it with. Just for GP's, I looked
at it with Pine, and it shows no control codes at all. I looked at it
through Dejanews and about half of the characters were missing.

2249. A-ONE... A New Atari Online Magazine

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-21 00:00:00 UTC
From: jmirando@portone.com
Message-ID: <7apa45$7pj$2@remarQ.com>
Source record: 54615

For Immediate Release

Former Atari Editors to Debut New Online Magazine

[February 19, 1999, Boston] Former STReport Atari Editors Dana Jacobson and Joe Mirando announced today that they have begun work on a new Atari online magazine. A-ONE (Atari Online News, Etc.), which will likely debut on Friday, March 5, will be a magazine primarily aimed to serve the Atari community, according to Jacobson. "Our goal," said Jacobson, "is to focus on a magazine which covers material of interest to fellow Atari users. We'll do our best to cover all facets of the Atari experience - computing and console gaming. But, we'll also cover topics that are of a general interest to Atari users: general industry news items and other gaming platforms."

"Joe and I have been using and writing about Atari computers for a long time," says Jacobson. "Between the two of us," he added, "we've probably written for most of the commercial Atari magazines of yesteryear such as Current Notes, Atari Interface, ST Informer, and Atari Explorer. And we just completed a lengthy stint with STReport, an online magazine. We have both considered doing an Atari online magazine on our own for quite some time now. The talks became more serious the past few weeks and many of our STReport readers were asking. The timing was perfect."

Jacobson states that A-ONE readers will see the same coverage as they did with STReport, but more. "Columns such as 'People Are Talking' will continue in A-One," states Jacobson, "and the Atari news items, various announcements and product descriptions will continue. We're also going to continue with the computing and technology industry news section, as well as Atari and other platform gaming news. All of that will remain unchanged, except cosmetically."

When asked what new things A-ONE readers will be able to see in the magazine, Jacobson reported that "we have a lot of new ideas; and we're going to be able to resurrect some old ones! We've talked to Michael Burkley, of Suzy B's fame. A-ONE readers will be happy to learn that Michael has agreed to bring back his "Unabashed Atariophile" column - a column devoted to Atari public domain, shareware, and freeware software. We're also looking to get more involved with Atari internet news. We're working on 'guest columns.' We'll be talking to a number of people to help us make A-ONE the #1 Atari online magazine worldwide."

According to Jacobson, A-ONE will be a text-based magazine. However, he stated that an HTML version hasn't been ruled out as an additional format. "We're in the process of establishing distribution points for the magazine," Jacobson stated. "We'll maintain our e-mail distribution

lists as well as making the magazine available on online services such as Delphi and bulletin boards. We'll also make it available for downloading via numerous Internet web pages. The best way to do this, and make it accessible to all readers, is text. But we realize that some of our readers may want to read A-ONE while on the Internet. The 'plain' text version will be available initially, but we're also considering adding an HTML version, with all the 'eye-candy,' for those who might want it."

To contact A-ONE regarding e-mail subscriptions or other inquiries, send e-mail to dpj@delphi.com . For submissions and related information, send e-mail to jmirando@portone.com .

Miner 2049er was killer. It had good graphics and a personality about it.
Jumpman was crummy, in my opinion. How uncreative can a platformer be?
"Jumpman." Who's the marketing wizard who came up with that.

Miner 2049er had a shtik. The miner guy attacked by mutants. Mountain King
was another ambitious game with a shtik, collect treasure, evade the giant
spider, carry the sacred flame past the skull of death and so on.

I know Jumpman was supposed to be challenging, but how mundane!

From: bmw3@cec.wustl.edu
Message-ID: <7apltb$b0s$1@nnrp1.dejanews.com>
Source record: 54617

As part of my attempt to resurrect an old 1200XL, I would like to burn two 27128 EPROM's with the original 1200XL OS data. Does anyone know where I could find ASCII text versions of the OS ROM images? That is, I'm looking for the compiled binary/hex/decimal listing of the OS in ASCII text, and not in a proprietary binary format.

Thanks.
Benjamin West

Cast Satan from Thee...

Jumpman uncreative?????

invisible levels, sequenced bonus elements, tight gameplay etc etc

Miner was my first Atari platformer but Jumpman still remains a
favourite and for such a "mundane" game it still got a sequel and had
imitators such as Wizard on the C64. What I think happens is that people
see the graphics and say "stick man"....Spend some time and complete
it..

Another maligned game is Chopper Rescue from Microprose, Ok its part
BASIC but what a fun game..

Bounty Bob is another matter, a cracker of a game that always ranks in
the top 5 of peoples games.

According to the history page, the TONG boards were designed by the Hong Kong design team for Atari and included everything on one board. The US (?) team designed a standard 1400XL board with daughter boards that made it a 1450XLD .

Who sais that Commodore people WANT to make Atari people feel bad?
At least we share the same processor.

> Typically, their arguments tend to the price poorformance of a C64 which
> came out 3 years after the Atari home computers. Computer years are like
> dog years, 3 years after & still being comparable is a losing argument.

Haha.. people tend to compare even an Amiga to a C64.. don't give a damn
about it. If your machine is "worse" than the C64 because it is older it
is no shame at all, so don't give a shit.
The problem we C64 have to face all the time is that people with
Computers that were worse or equal try to tell us that our machine is
shit. That is pure jealousy, because the C64 was sold that often. What we
do is ignoring those morons or sorting out lies that those people make up
just to justify their disadvantages.
I like the CPC and the Atari very much (just have a look at the links
section of my homepage), I won't ever tell an Atarian or CPC guy "your
machine is crap".. hell even if it was that way, I wouldn't care to do
so. We are people who love our old machines.. each one for its own
advantages, so spreading lies is just shit.
Most commodore people don't want to make you feel bad about your Ataris,
we just defend ourselves against lies and prejudices.

I really don't know, just quoting facts. From what I remember, they
were early-model and huge, before they decided to make one board for
both the 1400 and 1450, and just have a swappable disk controller.

Small points, they are 8k ROMs. Doesn't really matter if you want to use
16k ROMs, but you could stick more then one OS in there if you do or
only use one 16k ROM or do a Wooley mod & stick a 16k ROM, XL MMU, & a
basic ROM.

For all the text adventurers out there-
I asked a question about Infocom sites
some time ago and wasn't fortunate
enough to get a response. But I ran
across a site worth investigating. It
has links to a number of other related
sites, including Activision's site where
one can still purchase the collections
on CD Rom:
http://www.csd.uwo.ca/~pete/Infocom/

Being a big MULE fan, and a game collector of sorts, I recently spent $30 on a mint copy of MULE-- this was after I lost an auction on Ebay that had MULE, Realm of Impossibility, Seven Cities of Gold, Archon I and Archon II -- all 5 games went for $85. I shoulda bid higher, but my wife would have killed me :)

Anyone else have reports of MULE sightings? How much did it go for?

Thanks,
Steve

For the Atari 8-bit h/w info try the copy of De Re Atari:
http://www.pcc.net/dzone/atari8.htm

Also there's a copy of the technical reference manual at:
http://aegis.mcs.kent.edu/~clisowsk/8bit.html

The TONG motherboard was done out of Atari Wong in Japan. It was a
huge version of the 1450XL motherboard with the controller built onto
board for the disk drives, also it has additional ROM chip sockets and a
prototyping area. More or less it was a development board. The final
production boards were going to be the Atari 1450XL motherboards with
the disk drive controller daughterboards plugged onto the PBI interface
header on the motherboard.

I have never seen anyone with an actual card, however Magna Systems in New York used to sell a 256K RAM card for the 800 and also sold a 1MB RAM card for the 800 (which most likely judging from the 256K card I have, it was the same card fully populated). I think the guys name was Tony Stacato, not sure, check some of the older Antic/Analog mag's for the Magna Systems adds, who knows, he may still be in the New York City area and may still have some spare boards to sell.

Only one I can think of offhand is the FOLDOC (Free On-Line Dictionary
of Computing, at http://wombat.doc.ic.ac.uk/foldoc/index.html. Here's
their definition of "pixel":

pixel -->

picture element

<graphics> (pixel) The smallest resolvable rectangular area of an
image, either on a screen or stored in memory. Each pixel in a
monochrome image has its own brightness, from 0 for black to the
maximum value (e.g. 255 for an eight-bit pixel) for white. In a colour
image, each pixel has its own brightness and colour, usually
represented as a triple of red, green and blue intensities (see RGB).

Compare voxel.

(1998-05-08)

<snip>
> Then I explained the Atari constructions, and the idea of doubling
> pixel widths, and other such interesting phrases, and to a man they
> thought I was nuts (or that you guys were nuts :).

Then I can only conjecture that you were explaining the "Atari constructions"
very badly. Which stands to reason since, if you properly understood
them, we wouldn't be having this argument in the first place.

> Which brings me back to my original point: there probably isn't any
> official definition of "pixel", but the Atari use of the term is
> fairly different than the more commonly understood definitions.

No, it isn't. It sounds like the Commodore definition is the screwy one.

> >> It's only on the Atari that you can get strange sentences like
> >> "screen size is 40 pixels by 24 pixels" and "register x will change

> the pixel"? I highly doubt that, and sarcasm certainly doesn't
> make it more convincing.

Lessee... I right-click on the desktop, select the Settings tab... wow! Lo
and behold, I have a little slider that goes from "640 x 480" to "1600 x 1200"
PIXELS. And waddayaknow-- if I change it, my pixels get bigger! (or smaller).
You were saying?

> The key part in the first quote is the 40x24 -- your Atari generates
> a lot more than 40 phosphor dots horizontally; related to the second
> quote, each of those "computer addressable points" is an 8x8 block
> of pixels, not a "pixel of different width".

My Atari doesn't generate ANY phosphor dots. It does light them up though.
A 40x24 mode pixel (graphics mode 3, 2 bits per pixel) is ONE PIXEL. As
defined above and many times before, a pixel is the smallest addressable
display element, period.

> When you change from a high resolution in Windows to a lower one,
> are there the same number of pixels (i.e. phosphor dots) on the
> screen, so that the low-res points are a little block of multiple hi-res
> points? Or is there actually a different number of pixels (phosphor
> dots) on the screen? It is a serious question, which I don't know the

The fact that you're still equating phosphor dots with pixels simply screams
that you still don't understand what you're talking about. Unless you're
dealing with a color LCD display, one pixel practically never equates to
one phosphor group.

> answer to, but since the monitor probably changes frequencies when you
> change resolutions, I suspect the latter -- which would be very different
> than what the Atari does when you change resolutions.

Different, but not much different. At different horizontal resolutions, ANTIC
(hmm, or is it GTIA?) just varies the number of color clocks ticks between
output signal changes. It is by no means aggregating these imaginary "real"
pixels you're clinging to.

Hey, I've got an idea... go over to the Apple II forum, and declare that each
LORES pixel is really a 7x8 block of HIRES pixels. Heheh...

I'd like to hear several opinions on which Printer is BEST for the Atari
800-class computer, along with the reasons for your choice (reasons can be
ease of hook-up, compatibility, color capability, quality of output, etc.).
I'm primarily interested in those Printers which were roughly
contemporaneous with the Atari 800 itself (so, somewhere in the period of
1978 to, say, 1992, roughly).
THANKS!

WTB: 800XL compatible Power Supply.
My 800XL Power Supply just bit the dust and I have no spares.

According to the FAQ any of the following will work:
5 V DC 1.5 A (7.5 W) Atari#CO61982/CA024814 adapter:
600XL,800XL,65XE,130XE,XE Game System

I have classic items (2600, 7800, INTV, etc.) for trade if anyone wants
to go that route.

2287. Panasonic JR-200U

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-22 00:00:00 UTC
From: Gil Parrish <107765.1161@CompuServe.COM>
Message-ID: <e$On1ZpX#GA.247@nih2naad.prod2.compuserve.com>
Source record: 54556
Cross-posted to: comp.os.cpm,comp.sys.apple2,comp.sys.atari.8bit,comp.sys.cbm,rec.games.video.classic

(Sorry- can't find a generic "classic computer" newsgroup for this question.)

Anyone have knowledge of the Panasonic JR-200U Computer? It's a silver keyboard unit, chicklet keys, designed for tape access, and just says something like "32K Personal Computer" on the label. It has built-in "JR Basic"; many of the keywords are accessible with a single keypress (actually, CTRL plus the keypress), so many of the BASIC commands are shown on the keyboard. Still, I'm not sure how some of the commands work, I need information on attaching peripherals, etc.

If you have anything ranging from complete information to a distant memory of working with these units, please drop me a line at the address below. REMOVE ALL EIGHTS FROM THE ADDRESS SHOWN.

107765888.1161888@compuserve.com

I appreciate your help.

Gil Parrish

2288. Re: 6502/Atari hardware information wanted

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-22 00:00:00 UTC
From: "Steven E. Kosto" <kostos@ee.eng.ohio-state.edu>
Message-ID: <36D1AD0E.47B67185@ee.eng.ohio-state.edu>
Source record: 54557

Actually, you can still order copies of old Atari books from either:

Bravo Sierra Computers (http://www.teleport.com/~bensmith/bscomputers.shtml)
or
Toad Computers (http://www.ataricentral.com/)

There is an OK (has gaps though) memory map book called:

Mapping the Atari; COMPUTE! BOOKS;
Comprehensive sourcebook and memory
guide for Atari 400/800

It should be available at both companies.

Most of the hardware info on the computers can best be obtained from the
"Field Service" manuals for the specific Atari computers.
They contain full schematics and parts lists.

Hope this helps,

-sk

It was also known as the Matsushita JR-200. It used an 1800A processor (compatible with the 6802). RS-232 was available as an external adapter, model # JR-U05 and had floppy disk units available (Model #F01). I couldn't find much on the BASIC, though. I have an article about the JR-200 in an old Creative Computing magazine at home which explains a few of the BASIC commands in passing. I'm at work now but if you want me to dig out the article, send me e-mail.

You walk into a room, stand in the doorway, and have a patch over 1 eye.
The wallpaper looks just like the stuff that's in the room. Standing still,
you can't tell anything from anything else. Walking around the room, still
with 1 eye, you can see the parallax motion of things at different
distances. This works fine while in a room, but I agree that you can't
really use this to gauge the respective distances of a lighthouse and a
cliff beside it at night or something like that. If you can easily walk
around an object for 90 or more degrees, with one eye, your brain can
figure out the 3-space configuration of it.

Yeah. The only 2600 game to use the driving controllers was indy 500
(sears title was race). Stella sketch uses them also.
I don't know of any 8 bit games that use the driving controller.

2296. Diamond Gos cartridge for sale

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-22 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7ase8h$fbh2@news.ajou.ac.kr>
Source record: 54565

Greetings Atari 8-bit folks,

I was looking through some of my old Atari 8-bit stuff and
came across my Diamond GOS cartridge, software, and manuals.

At one time, I had this Diamond Gos cartridge and software
running with a hard drive, using SpartaDos 3.2d and or a
SpartaDos X cartridge. With a ICD 1meg Multi I/O (MIO).
It was alot of fun and exciting. I didn't have a ST at
the time and having a GEM like OS on a Atari 8-bit was
cool.

I haven't used the cartridge or software in along time.
I really don't plan on using the cartridge anymore and
am considering selling it.

The package includes...
Diamond GOS Cartridge
Diamond GOS Utility Disk
Diamond Paint Disk
Diamond Write Disk
Diamond News Station Disk
and these manuals and etc...
Diamond Gos Users Manual
Diamond Gos Programmer's Manual
Diamond Paint Users Manual
Diamond News Station Instructions
Also included are a couple of
Reeve Software Newsletters and
a few pages of reviews of the
Diamond GOS system. Which has
some setup info, plus a type
in program called Colorme.M65.
Reeve Software Business Card.

Also, if the buyer wants, I have the original receipt of the
person who bought this Diamond Gos cartridge. And what appears
to be a Genie E-Mail from Reeve Software on the subject of
Diamond GOS, and mentions Bob Brodie from Atari and what
Reeve Software thought that Atari would do with it.
Dated 11/22/89.

The cartridge, manuals, disk software and etc. are all original.
I don't have the manual or instructions for Diamond Write unless
it is on the disk. I'm not sure if a manual or etc. was made for
Diamond Write. Also looking at the instructions for Diamond

News Station, there appears to be 2 versions on the disk. One
is the standard News Station, the other is the Diamond version.

Right now I don't know what versions the disk software and
cartridge are. If this is needed I'll try to find out.

I will sell this package to the highest offer in US dollars.
Buyer pays shipping charges which is around 3 or 4 dollars
for US Postal Priority Mail. I prefer US Postal Money Order
for payment.
If you are serious about purchasing the package. I suggest you
figure out how much you are willing to pay for it and send me
a e-mail with your offer. I really don't like to haggle over
e-mail. Folks usually end up getting upset.
I do reserve the right not to sell the package if I feel the
highest offer isn't enough.
If a deal is made I will re-check the cartridge and software
before shipping to make sure everything works correctly.

Thanks,

E-Mail address..

If it was indeed Tony Stancato, he can be reached at The Fordham Jesuit BBS
(718) 8175500, where he is the subsysop for Atari 8-bit. BTW, Fordham used
to carry the Fido Atari National Echo, but has been cut off for some months.

Source record: 54567

Most of the guys who bought printers for the 800 bought 9-pin, dot matrix printers. Some bought Atari printers, which were direct-connect. Other brands, incuding Axiom also sold printers that went into the SIO line. Others bought an interface (850, P: R:, etc.) and usually wound up with Stars (like the SG-10), Panasonics, or Epsons (MX-80, FX-80, etc.) and their compatibles. I bought an Okidata Microline 92 because it had a reputation for high quality and ruggedness. There wasn't as much software written to be compatible with it as there was with the others, but I got by and learned to write drivers for it. The codes were kind of wierd. When it gave out after many years of service, I replaced it with another Okidata (Microline 320) which had both Epson and IBM emulations built in.

It's quite an achievement. Tom said that it's running in emulation and that he had to modify the code to Atari800 to get it to work, but it represents a potential return to PRO BBSs.

Do you mind a bit of soldering? I have found that any +5V power supply
that can do at least 1.5 amps works fine. All that is required to to cut
the existing cable off the burnt supply, determine which lead is ground
& which is +5V. Almost trivial since I think the shield is electrically
connected to the ground. You don't even need a VOM, continuity tester is
enough.

Probably the easiest to use are PC mini tower supplies. Several places
around my neighborhood sell them for ~$7 each for ones in the 150-250
Watt range.

All PC power supplies I have seen use RED for +5V, BLACK for ground, on
the power supply lines for drives. Whatever is left is +12V.

The latter, plus Mac versions. I didn't check
out Amiga or ST. Although if you check into the links, you may find some
additonal stuff.
There are also Z-machine interpreterss for many platforms, so it *might* be
possible to port the text databases to the A8 or ST or... However, that would
likely be a BIG job.

I just picked up a 1050 at the flea mkt today for $2. In it is a duaghterboard plugged into U9. U10 is missing and there is an2764 EPROM on the duaghter board with a sticker 'FIRMWARE (C) 1986 D.T.I' The other chips have their numbers rubbed off, but one looks like a controller chip, the other two are small logic chips, and the other possibly a static RAM. A dump of the EPROM code reveals 2793/2797 VERSIONREV 3.00 7-19-86COPYRIGHT (C) 1986 BY EMCCOPYRIGHT (C) 1986 BY DTI.

Any clue as to what this thing is?

As always, Thanks

Most (all?) of the Laser printers use PCL as do the DeskJets. You should not have too tough of a time upgrading from the older devices. The newer printers come with scalable INTERNAL fonts, which means you can do 144 point type from your 8-bit with very little effort. They really work well since most of them have lots of processor power, leaving your Atari to the important stuff.

Hi Bret-
Thanks for the good info. Do you have any
general information (or know of somewhere
to look) about the general structure of the
Infocom games and Z-machine interpreters?
For instance, I would presume that a ZM
would need some type of random access into the text databases. On an Atari,
the closest
thing is index-sequential, where an index is
set up to point to a particular sector containing
the data needed. The data itself is (usually)
a sector by sector (sequential) file. I presume
(but don't know for sure) that this is what
Infocom does on the A8. I did D/L the
Zorks freeware.
Thanks,
Larry White

Hi all !

Maybe you are interested in the German ftp-site
ftp.gmd.de (change to the folder if-archive).
There are some utilities for transforming Atari-8-bit
Infocom-Stories into files which are readable by
common inform-interpreters. Maybe this is a help
to do the other way round....?
I think the interesting thing would be to transfer also
the hundreds of freeware adventures available at this site
to the Atari-8-bit.

I bought an Okidata 82a. to print off my 400... then 800.... an IBM'er friend turned me on to Oki's.. it is, no doubt, a tank. I added Okigraph.(graphics chip set) .. for a short time, then bought 'OK Writer' which is a chip set/daughter board which enaables the 82a to emulate the 92a and perform... ready for this... NLQ... Near Letter Quality!!! This printer is now hooked up to my PC - my wife runs her companies checks wiith it!

2 other printers come to my mind, that I've used anyway... the 822 thermal... I have 2... they're fun.... and ..... I bought a Silver Reed daisy wheel typewriter that had a Centronics port!

CLACK..CLACK...C LACK... CLACK!!
B'rgds,
Vinnie

>Miner 2049er was killer. It had good graphics and a personality about it.
>Jumpman was crummy, in my opinion. How uncreative can a platformer be?

Jumpman was GREAT (for its time)! But, that's my opinion.

>"Jumpman." Who's the marketing wizard who came up with that.

While I can't verify this, I think they got the name
"Jumpman" from the Donkey Kong arcade game. The Mario
character was originally called Jumpman in the docs.

>Miner 2049er had a shtik. The miner guy attacked by mutants. Mountain King
>was another ambitious game with a shtik, collect treasure, evade the giant
>spider, carry the sacred flame past the skull of death and so on.

>I know Jumpman was supposed to be challenging, but how mundane!

Miner was great, too. But Jumpman had 30! levels.
Much more gameplay.

Mario

Michael Geyer <geyer@mpia-hd.mpg.de> wrote:

: Maybe you are interested in the German ftp-site
: ftp.gmd.de (change to the folder if-archive).

Yes, ftp.gmd.de/if-archive is definitely the place to look.
rec.arts.int-fiction is the newsgroup to watch for people who know how to
do this sort of thing.

: There are some utilities for transforming Atari-8-bit
: Infocom-Stories into files which are readable by
: common inform-interpreters. Maybe this is a help
: to do the other way round....?

There is also a PC program that takes Infocom-compatible data files and
builds C64-compatible images. The author extracted the Infocom
interpreter code from a 64 image and then discovered how to build the data
file into a disk image in the proper format. If you could do the same for
the Atari format, you could write the same sort of program.

: I think the interesting thing would be to transfer also
: the hundreds of freeware adventures available at this site
: to the Atari-8-bit.

I think one of the limitations would be that the Atari only had a Version
3 interpreter, while the vast majority of the freeware adventures are
Version 5.

The best source of information I can point you to is:

http://www.csd.uwo.ca/Infocom/

They have Zmachine code for pretty much any platform, including Atari. I'm
not sure if it's for the ST series or for 8bit, nor at present do I have a
way of checking... (since it's in ZOO format I can take a good guess which
it is)... (sorry my Atari is somewhere between here and Pensylvania ;-))

As to your question about random access... my first ignorant repsonse would
be "why don't you load the whole file into memory?" But after 3 seconds of
thinking I realized it's difficult to squeeze 120K+ of information in 16-48K
ram =P Soooooo, I'm not sure. Perhaps it would be possible to load sets of
rooms as a player passes from one area to another... but make the sets
somewhat over lapping so if you leave one room and then go back to it,
you're not waiting for disk access between two specific rooms...

hope this helps. Once I get my atari here, I'll see if I can get any of the
code there to work.

regards,
bret

There are Infocom interpreters out there in assembly, including a 6502
interpreter for the Oric computer. Studying it, and the general documents
on "How Infocom games work", would probably be a good start towards
writing a new Atari interpreter.

DOUBTFUL...?

I entered the suggested command line -- for EACH of my BASIC carts in
turn -- and I got the SAME result: 162, which you indicated meant "Version
A".
BUT...how can that be? The cart I have identified as a "Rare" Version C (see
http://www.geocities.com/~icollect/400rarity.txt) was produced in 1985,
which should have been long after versions "A" and even "B" were produced.
Could the "A" version and the "C" versions have been produced concurrently,
or is your TEST procedure incorrect, or is the "Rarity List" information
incorrect???

Hmmm....

I'm not sure you'd want to get your hands on Rev. B as it is buggy. It will
add 16 bytes of code to your file every time you save it, so it grows very
quickly. Eventually the file will be too large to be read into memory...

Source record: 54456

(This is a favorite topic of mine. I'm not in agreement with
anyone I know of.)
I've done a LOT of Atari BASIC programming.
Version B was a recompile, with lots of differences from
version A. Version C was a 12 byte 'patch' to B, to solve
the 16 byte append with each SAVE.
My experience is, version C locks up more, causes messed
up variables, forgets/loses DIMs and many other 'quirks'
make it unreliable when you spend hours in the BASIC
environment actually trying to program something.
Version A also is unreliable and locks up, etc.
Version B has less of the hangups and other unreliable
things occur with it when you actually do some programming
with it.
I would suggest that anyone using version C for fairly
serious efforts will be frustrated much more often
than if you use version B.
The 16 byte append with B can and must be gotten around
by a LIST, NEW, ENTER about every 4th or 5th SAVE.
Also, there is something that can make a LIST, NEW,
ENTER not work. This can frequently be gotten around
by have the single line 0 REM in memory before you
ENTER.

```
While we're on the A B C BASIC thingy.
Yes, I've had programs become unLOADable from the appended garbage
of version B.
I wrote a SALVAGE.BAS to recover such unLOADable files.
It makes a LIST file, which might need a small amount of
editing with SpeedScript or other plain vanilla editor, but
it can salvage B unLOADables, and also make readable
BASIC files out of files made unreadable by the wiping out
of the variable name table (a copy protection or rather
'keep anyone from reading my code' technique.)

Of the printers I've used on my 8-bits, the Gemini 10X fits best into your question, mostly because of the timne period you suggest. However, the best one I've had came out in '93 or '94--The Epson LX-800. It has several capabilities the 10X doesn't, most notably NLQ print. It's also much faster.

I also have a Star NX-1001, circa '95. I didn't like it so well, because it has a push tractor, and sometimes the paper hangs up slightl;y on the perforations. The ribbon only lasts about a third of the Epson, too. I had a 1025 too, but it was s l o w and only had draft text--no graphics. But, it was built like a tank and didn't need an interface.

Hello, how are you? Fine I hope!?! I on the other hand could use some help... I'm Ben Smith of Bravo Sierra Computers. I sell Atari on the InterNet. I've made numerous transactions using the InterNet over the years. More than I can count. Now I have someone who is questioning my ethics. A deal between us went sour and now my reputation is in jeapordy. I admit I could of handled it better. I should of kept my cool and refrained from accusing Frank Traut of Character Assassination and smearing my reputation. For this I offer my sincerest apologies. Still I could use your help. I need some Champions to stand up for me. Over the years I've served a number of satisfied customers. Including a strong base of repeat customers. I would appreciate it if some of my customers would post regarding their experiences dealing with me. I need Champions to redeem my reputation in the InterNet NewsGroup: alt.atari-jaguar.discussion. And if you have a complaint against me, well it's a free country.

==Thanx==

The 1027 power supply is just a transformer pumping out 8.5vac (or 9.5) at
about 4.5 amps. They are great because they open up (there are screws
under the rubber feet), and are fuse-protected. I have often used them as
the ac end for constructing replacement power supplies.

Why drill? Just replace the plug.

BTW if you take a dead 1027 apart, you can cut the 5vdc portion of the PCB
off, hook it up to the power supply and get a really good 5vdc supply (the
capacitor is around 14000uf and the rectifier bridge is really heavy
duty).

You'll need an FSK which can handle the 19K2 data-speed, but you don't need anything like handshake, cause the data-recorder (supposing you wanna read data from C:) is a "stupid" device, which will just Start-or-Stop, nothin' else...

And you need ofcourse an OS-patch, or a special loader to load the actual data into memory...

>1978 to, say, 1992, roughly).

I would say the Star NX-10, but that was a bit later than the 800. I
later sold my NX-10 and replaced it with a Star NX-1000. The NX-1000
wasn't nearly as ruggedly built as the NX-10. The NX-10 was easy to
use, and had Epson/IBM compatability modes. It was also very
reliable. I had problems with the NX-1000 getting the tractor paper
jammed a lot. Wish I would have kept the NX-10.

Of course now I'm stylin with a big, rugged, industrial strength (and
expensive) 24pin Okidata ML393C+. One of the best dot matrix printers
you could own I reckon.

Hello !

> How do I convert Atari .exe files(downloaded to my pc) to .atr files
which I
> can use with my emulator(Atari800Win)?

Show onto my ATARI-HP http://home.t-online.de/home/hcrburk/hpatari and
download ATARI FileManagement (Win 9x only !!).
You can import/export and list your ATR/XFD files (DOS/MyDOS/SpartaDOS).
Creat an new ATR-File (format it) or use an available and import your files.
Over the tools, you can integrate your emulator or other programmes simply.

There are THREE versions of Atari BASIC Computing Language, as follows:
Atari CXL4002 79 BASIC Computing Language [ver. A] C
Atari CXL4002 ?81 BASIC Computing Language [ver. B] ER
Atari CXL4002 85 BASIC Computing Language [ver. C] R
One of my BASIC carts is not dated, but instead has "R 39 2" stamped (you know, "recessed") into the front of the cart (in very small letters). How can I know if it is the version "A" (common) cart, or if it is the version "B" (Extremely Rare) cart? I also definitely own a copy of the version "C" cart, because the DATE is written on the label, but I am curious whether my other BASIC cart is version "A" or version "B".
Does anyone know how I can find out? Is there a "command" I can type that will tell me the VERSION of my unidentified BASIC cart?
Thanks,
--MB

I don't think it would be that difficult to port the text databases. I have stripped the databases out of the PC versions of Zork I,II, and III and have successfully been able to compile Z-machine code to run them on my mac, on Unix (AIX) and under Java on the web...

You can check out Zork I at my website... If it won't accept commands, click on the applet and then you should be able to play. ;-)

http://www.people.virginia.edu/~blk3z/text_adventures/zork1.html

My point in all of this is, all that would have to be done is to port a Z-machine interpreter... the data files should work as is. I think there may already be an Atari port out there. Check for a program called Frotz. If you need the data files for the the Zork games I'd be happy to send them to you since Activision has released them as freeware now...

I have one of the "silver label" carts -- dated 1985 -- yet inside it has "2 chips mounted to a green board", and it also indicates under the "Command Line" test that it is Version "A" (yielding result: 162).
I guess that means Atari continued to produce Version "A" carts even after Versions "B" and "C" carts had begun production. If anyone has a duplicate Version "C" cart on hand, I'd still like to either buy or trade for it.
Please e-mail me if so inclined. Thanks.

Then you've got the best way available though APE might prove to be better software for your purposes.

> but i need to automate the mounting process,

Use a batch file or DOSKEY macro on the PC end and a batch file (Sparta/BW/DOSXL/TOPDOS/DOSXE) or AUTORUN.SYS (MYDOS and others) on the Atari end.

> and i would like to use larger disk volumes.

Use SpartaDOS or MYDOS on the Atari; either allows you to go up to 16mb in disk size.

My 2 cents:
IIRC, Rev A carts were all that were sold as Atari packaged carts, nomatter how the cart looked on the outside. Rev C carts were available by special order from Atari for a while, but most carts that have Rev C were made by Atari vendors by putting Rev C roms into a cart case. (do ANY carts have Rev B? I didn't think so, unless a sadist was involved).
For those of you new to Atari 8 bit: Rev B was what came built into the XL series, except for the 1200, which has no BASIC installed. Rev C was what came built into the XE series.
The older looking Atari Basic Rev A carts were made during the 400/800 days. The newer looking Atari Basic Rev A carts were made during the XL days, to allow those using XL computers the option of using Rev A. I've never seen a BASIC cart in the XE type cartridge case.

SIO2PC accepts command line arguments. I have a couple of old 20 meg 3.5" drives set up with just an old version of DOS or DRDOS that load & go large ATRs. One of these is an old 10 Mhz 8088 with built in printer & serial ports, but I don't have a keyboard or monitor attached: Fairly compact package. Just power supply, small footprint MB, 3.5" HD & short controller card.

I have fooled around just a bit with passing commands to the PC via Nick's programs included with the SIO2PC distribution, but never got beyond looking at a few commands.

That sounds correct... I think... Yes... Atari shipped rev C carts to me... I think it was due to problems with Rev B in the XL's (gotta remember back a good 15 or better years!)... I never heard of any vendor assemblying a C cart, or 2 different cart housing's with the same 'A' board on the inside... Hmm... that's some interesting news.....guess anything's possible!

I have some of the software for it. I am using one myself and it has a copy protected copy program. It won't copy with the DTI. It copies most disks, but have trouble with the COPY DISK and Alternate Reality I think it couldn't do. I have some accelerator software, which claims a 5x increase in speed, but works bad on protected disks of course. I can try to collect up the disks in .ATRs and put them on my page. The copier itself won't work, but maybe you can hack it ???

Let me know if you want me to do this. I have a few different versions of the programs that came with it!

2366. Atari 400 KEYBOARD

My 2 centsworth:
I own an Atari 800. I am thinking about also buying an Atari 400 (already upgraded to 48k, or else I'll do it myself).
Personally, I LOVE the Atari 400's membrane keyboard...it's what makes it unique! You will never have to disassemble your original 400 keyboard to clean between the keys. Also, the 400 is light and compact. The membrane keyboard is a masterpiece, and THAT'S the main feature that would cause me to ever want to buy one!

I have a few simple questions for all of you.

1) If you could play any of the classic 8 bit games again what would they be. A top 5 would be good.

2) Which characters (i.e. Jet Set Willy) stick most in your mind.

3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make to old games. Would you improve the graphics for instance?

4) Does anyone know who owns the rights to any old games or characters.

Answer back soon

I'm an Atari person, and I still have multiple Ataris hooked up. So the question "If I could play..." isn't really accurate. Here's what I play most often.

1) Ballblazer, Atari 7800 - Probably the best two player game ever. The 7800 version seems somehow smoother to me than the 800 version, and since it only uses one button, you can use Wico sticks on the 7800.

2) Robotron 2084, Atari 800 - Love this game. I duct tape two Wico sticks to a board to play this thing as it was intended. A couple years ago, when I played a bit more often, I could play as long as I felt like it: the game couldn't kill me.

3) Boulder Dash, Atari 800 - And its followups/clones. Incredible blend of strategy and action.

4) Bruce Lee, Atari 800 - This was an okay game when I first bought it, but when I got to college I found a cracked copy with infinite lives. We'd play this thing for hours: the two player aspect, although not perfect, was pretty cool.

5) Fort Apocalypse, Atari 800 - The sounds helped make this game immersive for me; as immersive as a game could be at that time, I guess.

> 2) Which characters (i.e. Jet Set Willy) stick most in your mind.

I don't remember his name, but the Boulder Dash character who taps his foot at you if you stand around too long still makes me giggle.

> 3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
> to old games. Would you improve the graphics for instance?

For most of the games I like best, I'd like new levels. It's unfotunate, but I have come to associate "improved graphics" with "worse gameplay." Boulder Dash, for instance had terribly clunky graphics, but I could run in and out of streams of falling rocks and diamonds on certain levels: fantastic gameply contol.

> 4) Does anyone know who owns the rights to any old games or characters.

Can't help you here. I maintained the original cross-post list, I hope I haven't offended any non-Atari folks by doing that.

Jeff

|I have a few simple questions for all of you.
|
|1) If you could play any of the classic 8 bit games again what would they
|be. A top 5 would be good.

1. The Nemesis Sage... (Gradius on some systems)
2. Metal Gear/Solid Snake
3. Boulder Dash
4. Zanac-Ex / Aleste
5. Penguin Adventure

|2) Which characters (i.e. Jet Set Willy) stick most in your mind.

1. Metal Gear
2. YS
3. Fray
4. Princess Maker
5. Final Fantasy

|3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
|to old games. Would you improve the graphics for instance?

Nop.. I would keep the games as they are... The GFX and the sound are just
the things that give these games their atmosphere... Maybe tune up the
resultion a bit, but that would be all.. The last MSX games featured over
19000 colours and 9 channel FM/PSG music.. So this was quite good !

|4) Does anyone know who owns the rights to any old games or characters.

Nemesis, Metalgear, Penguin Adventure -> koname http://www.konami.com
Zanac-Ex Compile
YS / FInal Fantasy -> Falcom
Fray / Princess Maker -> Micro Cabbin....

And if you wish to play these games and anjoy them in full glory.. Just go
to: http://www.casema.net/~tfh and download the fMSX emulator together with
these games... All these games (And some 1200 more !!!) can be found online
right here.

Greetz,

Arnaud de Klerk

Hello,

There was some BASIC command that fixed that problem or some group of
steps. I can't remember, been too long. All I know is that back when
all I had was a 1010, I used that "fix" ALL the time.

2375. 800XL controller problem

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-24 00:00:00 UTC
From: Tom Randall <Kf6ddt@viking.cris.com>
Message-ID: <7b1ten$42p@chronicle.concentric.net>
Source record: 54408

Greetings fellow Atarians,

I recently noticed a problem with my recently acquired 800XL. When a joystick is plugged into the secondary controller port, everything works fine except for the "down" direction. I have swapped joysticks so I know that the controller itself isn't bad. Any ideas what this could be and how fixable it might be?
Thanks in advance for any info.

The Arcade games run by mame are usually nice things. It's just a shame
that most of the moe intresting stuf is way to slow to be enjoyable
(even on SA)

Things like Paperboy, Super Sprint, Blasteroids, Road Blaster, Space
Harier etc.. spring to mind

> 2) Which characters (i.e. Jet Set Willy) stick most in your mind.

No particular charactor really...

> 3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
> to old games. Would you improve the graphics for instance?

Those old arcade games like e.g. Super Sprint or Paperboy have on MAME
a decent resulion and colours so I definitly wouldn't change it. The
sounds is cracky but if that would be fixed it'll be alright too.

All I want to see is that these games become enjoyable
(faster/original speed) instead of an old jerky slow representition of
it.

> 4) Does anyone know who owns the rights to any old games or characters.
>

Perhaps the mame ppl can help. Some o/t above mentioned games are
ï¿½Atari but names to remember are Konami, Warner, etc...

I feel that things have come along enough to announce this. You can access a BBS running BBS Express! Professional 6.0b at-

telnet://cth.tzo.com

If it won't connect when you try to get on, there is probably somebody already logged on. Just try again later. There is also a web page at-

http://cth.tzo.com/pro/pro1.html

One more item of note, is that the ftp server has been taken offline indefinitely. Watch csa8b for if/when I decide to put it back up again.

On Wed, 24 Feb 1999, Richard Wray wrote:

-)1) If you could play any of the classic 8 bit games again what would they
-)be. A top 5 would be good.

Lots of games (in no particular order).

Quazatron on the Speccie (I nearly wrote a version for the Amiga a few years back, but I lost interest, so I ended up with an isometric map like Quazatron with Robots moving around and the ability to move around it and do nothing else).

Spindizzy (Amstrad version).

Scuba Dive (Speccie version).

NetherWorld (Amstrad).

Uridium, Nemesis, Salamander, etc. (a mix of all those games).

Personal Fave: Times of Lore (C64 / Amstrad).

-)2) Which characters (i.e. Jet Set Willy) stick most in your mind.

None really. Games were the focal point back then, not characters (Lara Croft comes to mind). Of course, monty mole and Roland (CPC only) come to mind, but not to any great extent.

-)3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
-)to old games. Would you improve the graphics for instance?

Of course. Definitely higher resolution and more colours. If these games are to be brought back as near copies of the original for the PC, Acorn, Amiga, etc, then higher resolutions are a must. At least 800x600 for the PC. And a lot of colours! More detailed gfx and more varied gfx come to mind for a lot of games.

Updated sound as well would be cool. No MIDI though, it is worse than a Speccie 48k 1 bit beeper sound. Big fat chunking samples etc.

I saw a '3D' Chuckie Egg last year (looks the same, plays slightly differently :-( ) and that was pretty cool.

-)4) Does anyone know who owns the rights to any old games or characters.

No.

Graham

Just an odd thought, but I know if I had a screwdriver, I could probably change the boards myself?

Maybe someone just had a Rev 'A' with a broken case, and a fried Rev. 'C' cart... A screwdriver... 5 minutes, presto, working BASIC cart.

I know if had been then years ago (when I was a tad younger) and knowing nothing about different revisions I'd do something like that.. heck I'd probably switch them today if gave me a working cart.... but I'd tell you if that's what I was selling you... :)

just a thought,
bret

Essentially, you copy the "B" ROM into RAM and then change 16 bytes, most of which replaces existing code with NOP's. I believe the actual addresses and values were published in ANALOG and if someone's really desparate, I'm sure I can find them.

The real question is "Why bother?"--TURBO BASIC is so vastly superior to Atari BASIC (and bug-free) that there's really little need for the Atari version.

John

Try looking directly at PORTA with a debug program or you might even get
away with BASIC (i.e. PEEK 54016 while you move the stick).

2387. Interested in a Bounty Bob Strikes Back cart?

Date: 1999-02-24 00:00:00 UTC
From: swozniak@aol.comeGETsome
Message-ID: <19990224150422.01127.00002109@ng-fp1.aol.com>
Source record: 54420

As luck would have it, I happened to pick up another copy of this great game recently so I'm probably going to sell it. This is the sequel to Miner 2049er for the Atari 400, 800, XL and XE series of 8-bit computers. The cart is loose (no box or docs) but in great shape. The label is clean and completely intact. It has been tested and is in 100% working order. If you're interested, send me an offer. If I don't get offered what I feel it's worth, I'll put it up on eBay. You can check my references here:

http://cgi2.ebay.com/aw-cgi/eBayISAPI.dll?ViewFeedback&userid=scottwozniak

Thanks for looking.

-Scott Wozniak

Remove the "eGETsome" at the end of my address to reply.

Unless you get a "Win" model printer, or modem, or anything else.
Make sure not to get any hardware that is a "Win ______" anything.

Indeed it was. The NX-10 was a new and improved model of the Gemini
10-X. Well built printers. The later NX1000 was kind of more cheaply
built.

Action! is an OSS bank switched super cart. I have it. I loved it.
I also have a binary file of Action! which actually half-assed works.
But like I said, it doesn't seem to work completely right.

I don't know but I tried that peek on the 3 versions I have. In my
800XL I got the result for version B. I have an old BASIC cart which
I bought because the bugs in it weren't as bad as the bugs in B and
that indeed returned the proper value for rev A. I then did the test
on an emulator which I use a file for the ROM. I was curious what
version of BASIC was imaged for that file. It turns out is the rev C
which is completely bug free (we hope).

Rev A was buggy also. Rev B was to fix the bugs in A, which it did.
But then (so the story goes) whoever fixed A saw something else which
they also assumed was a bug (but actually was not) and went and
"fixed" it too, thus creating that nasty bug in rev B which is
probably worse than the ones in A.

2393. Re: "RARE" ATARI BASIC?

Message-ID: <vNJA2.540$NU.323629@newse3.tampabay.rr.com>
Source record: 54476

Can you tell me if Rev C cart has any APPEARANCE TRAITS that will visually identify it as DIFFERENT from the Rev A and Rev B carts? For example, is it a "silver" cart? Does it have different script on the label? Different wording? Is there any way to distinguish it other than booting it up and typing the "command line" test?
Thanks,
--MB

In a previous article, macfalkner@aol.com (MacFalkner) says:
>Most (since the last years all) of the pc keyboards have an ghosting
>software algorithm to detect more than one keypress at the same time.
>This algorithm can detect exactly 3 (of 4 in a matrix) separated keys.
>The keyboard sends an "make code" for every keypressing and an "break
>code" for every keyrelease.

Does this explain why most PC keyboards (the ones that I have tried so
far) have such a miserable "feel" to them? Is this why so many are so
poorly debounced?

>poorly debounced?

No. The 'feeling' of a keyboard depends on the mechanical characteristics. Most (cheap) keyboards doesnt have microswitches (there are only some foils and the pvc sliders), therefore you cant feel an exact presspoint. This has nothing to do with the keyboard included microcontroller or the software that runs on it.

If you want a good pc keyboard you must invest something more. Look for a keyboard with real microswitches. Go to a computer shop and try out. Im sure you find one wich feels good and im sure that will not be the cheapest... :-))

The Rev 'A' cart was the standard, old, Brown label cart with yellow lettering.. inside, 2 chips mounted to a green board...

the Rev'B' was found in XL's, I believe....

Rev 'C' had, as you said, a sliver label with black lettering... inside, there is one chip mounted to a pink board...

Outside of that, I - as a non-programmer- have never noticed any difference..but now stick to rev 'C'!
B'rgds,

Yes, if you really want it but the loader I wrote for it is only
guaranteed to work under Sparta.

> I tried MAC65 but I have no docs.

Use it as you would the Editor/Assembler--it is fully compatible--just
adds a lot of other features.

> Does mac65 have the debugger built in.

Disk versions: no; cartridge, yes.

> That was a big + on the edt/asm cart.

Sheer laziness causes me to use the DDT built into the MAC/65 cart. I
believe the debugger (is that really a word?) included with the MAE
assembler is probablty superior.

My own preference is MAC/65 (disk version) with a variety of debug and
"hacking" type programs. I like the disk version because it doesn't cause
a reboot on my MIO-equipped computer when I hit Reset (the cartridge
does--all the time).

TP84 blew me away in the arcades. I seem to remember it having FAR
better graphics than it actually has... But I love those 360ï¿½ shooters
with ground emplacements and the like. That's why I love Dyzonium on
the SAM Coupï¿½.

> version.

Errmmm... I don't think Turbo Basic is bug free (even without taking
the compiler into consideration). It does tend to get a bit screwy
when programs get big. I know there is a problem with strings when
you have a lot of strings/variables. The way around that is to do a
LIST/NEW/ENTER cycle (hmmm.. where have I heard *that* before? ;) which
rearranges the variable table, but then the problem might re-appear
somewhere else.

Also Turbo Basic uses the RAM under the OS, so won't work with
anything else that does that too (most versions of SpartaDos, DOS-XE,
etc). But I do agree that TB is superior to Atari BASIC for most things.

-)> Updated sound as well would be cool. No MIDI though, it is worse than
-)> a Speccie 48k 1 bit beeper sound. Big fat chunking samples etc.

Except for the really good games (i.e. the later ones). I forgot to point that out. Also those MSX2+ games which look pretty good, except I cannot get fMSX to work under Linux, (well it works, and then it cacks up). But those old 2 colour spectrum games and lo-res CPC + C64 games would like a nice resolution boost, and colour boost! Remember what a lo-res game looks like on a modern PC monitor (argh!). Of course if these games were to be produced for something that displayed on a TV, then the resolution is not a worry.

Shame that there are so many great old 8bit games out there that could be ported to more modern systems, but there isn't the time. I suppose writing them now would be easier though, less constraints (like memory, speed) to worry about, so straight C and standard sprite libraries should suffice. Still need graphics and sound artists though!

-)[Points at Briggsy]
-)With him, Screamtracker sound support, please. =-)

Yay! You have agreed with me for once!

No Prehistorik 2 has the title (although Fluff was excellent too) by the
way, I have finnally found a way of getting Prehistorik 2 & Super Cauldron
on to 3" disc from the dsk images on the web, here goes...

1. Down load the images, play them on the Emulator no probs,
2. get your CPC/Plus COPY MOD'ed
3. Buy Xexor v2.6
4. Copy .DSK's to 3.5" floppies with CPDWRITE.EXE
5. Buy a 3.5" floppy drive for you CPC/Plus
6. Backup from B to A using Xexor with the commands D B,A [Enter] BACKUP Q
[Enter]
7. load the game on CPC/Plus from drive A

>

Metal Gear (MSX, Konami co., Ltd / www.konami.com)
Ancient Ys Saga (Part 1 and 2 that is, MSX, Nihon Falcom co. /
www.falcom.com)
JetPac (Spectrum, Ultimate games)
RuneMaster (MSX, Compile co., japan / www.compile.co.jp)
Daiva IV (MSX, T&E Soft)

>2) Which characters (i.e. Jet Set Willy) stick most in your mind.

Solid Snake (metal gear series)
Adol Kristin, Lilia (Ys series)
Latok, Fray, Pixie (Xak Series)
Joe Kowalski (Blow Up)
The Konami Penguin (Antarctic adventure, penguin adventure, parodius)
The Snatcher Cast (Snatcher, SD Snatcher)

>3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
>to old games. Would you improve the graphics for instance?

Yep I would, I read some comments that it would ruin the atmosphere in
the games, mmmm if you do it well you won't......imagine the old Metal
Gear with higher resolution and real time lighting effects.....I would
boost the sound too...

>4) Does anyone know who owns the rights to any old games or characters.

In most cases the rights on characters are owned by either the
publisher or the developer.....Like most people would say Crash
Bandicoot is owned by SCEA, which isn't true....Crash is legal
property of Naughty Dog Inc. (LA). Anyway, most companies that made
the classics are still in bussiness....and so they will still have the
rights to both the games as the characters. The only exceptions I know
are T&E Soft, which doesn't exist anymore, Ultimate games, they
changed there name to Rareware Ltd. in 1986, dunno if they kept the
rights on their older games (JetPac, KnightLore, Alien-8)

Compile went bankrupt, but restarted half a year later....and since
they are making a new Puyo game I would say they still have their
rights.....and T&E Soft was a Matsishita company....not sure who owned
the rights to their games.....

>Answer back soon

Hope that was of any help.....open for further questions

In order to get dual sticks on the 7800, I took apart two standard 2600 sticks and reversed up and down. Then, I hold the base of each stick in one hand and put the top of the stick on the floor or whatever I'm sitting on. Carpet or upholstery works best.

You can try it without modifying the controllers to see what I mean, but when I did this, I just couldn't reverse up and down in my brain no matter how hard I tried. (I even tried thinking of my little man as a gun site and pretended I was flying a plane, but then his shots seemed like they were coming toward me!) Oh well.

Don't laugh (at least, not too hard) until you try it!

I've seen this, but I hesitated. I don't like the PSX game pads much, I use the Dual Shock which has an almost joystick-y feel to it. But the Robotron PSX package I saw said it wouldn't work with the Dual Shock.

Can you run/shoot diagonally? That's my beef with the MAME version, it's REAL hard to do that.

Jeff

Hi,

Now this question really has got me thinking!

What 8bit game did I really enjoy and still play, other than my top 5 listed earlier in this thread here is a list of other titles that just missed out on the CPC/Plus....

Rainbow Islands,
Klax,
Super Tetris (P.D.),
Nigel Mansells World Championship
Continental Circuis
Titus the Fox (The first game to really show how good CPC grafix cood look)
The Blues Brothers
Hudson Hawk
Switchblade (Cartridge)
Stryker in the Crypts of trojan

The list goes on for ever!!

Thanx

Craig

Yep, no problem. Diagonals for both directions and shooting are pretty
easy with the layout of the PSX pad, I find. I certainly don't have
any problem with it.

>
The BBC is the king of 8bit games

1. Castle Quest - Best arcade adventure ever made
2. Missile Control
3. Arcadians
4. Yie Ar Kung Fu
5. Dare Devil Dennis
6. Exile (this could be a brilliant conversion)

>2) Which characters (i.e. Jet Set Willy) stick most in your mind.

Repton must be the most famous.
>
>3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
>to old games. Would you improve the graphics for instance?

Every conversion which has improved the graphics has lost a great deal
of gameplay. The only truly brilliant game evolution is Spheres of
Chaos - much more fun than Asteroids.
>
>4) Does anyone know who owns the rights to any old games or characters.

People without much else going for them.

Even tho you checked the joy port with two joysticks, it isn't
hard to take out the screws and open up the joystik. It is
common for one or more of the wires to come off the tabs inside.
You could check for that.

If you have a bad pin on the computer side, you might check the following
things:

1) See if the pin is pushed in/bent
2) Open up the XL and examine the port connections. I can't remember if
this stuff was solderable or not...you'd just have to take a look.

Indeed my 600 XL machines also have a monitor jack.
Maybe I was just confusing them with 400 machines.
Then again it looks like "domestic" 600 XL machines
do not have a video output.

>19k2 and up :-(...

820 baud is the maximum baud rate the standard OS supports.
The quality of the FSK decoder inside the cassette units (like
the XC12 and 1010 etc.) appears to be unable to make a
reliable data signal out of such high baud rates.
Why would you want to save the audio on a MD or CD?
you can *not* input audio into the XL/XE. The audio
is converted to digital data bits on the SIO bus by the
FSK decoder inside the cassette unit. You would have
to make some sort of audio input on your cassette unit.
Besides, with the wav2cas program, you can convert
the audio to a .cas file. Then you could convert that to
an ATR again, and load it at 19.200 with APE or SIO2PC
provided you change the boot code. If you can patch the
OS, you can load the tape from a PC at 19.200.
Maybe some boot code can make this patch on a XL/XE.

There seem to be cassette units (modified) that get up to
a baud rate of 2000 i.e. the Turbo 2000.

There is no handshaking with cassette units, they just read
data and never acknowledge it.

But, thanks to Tom Hunt, there is TB32Q which is essentially the 800 version stripped of the built-in DOS 2. It runs quite well under Sparta, the only problem being that FRE(0) is somewhere around 20k. For those rare occasions when I really want to run a large BASIC program, I use revision C in RAM (I'll be damned if I'll reduce my 1mb upgrade to the equivalent of a 320k machine just for the sake of BASIC).

The thing might have printed 20cps going downhill with a tailwind.
Essentially the noisy beast sucked big time. The power supply however,
when cut out of the PCB, is an excellent 5vdc source for feeding the
Atari.

The Happy was superior to the Duplicator, at one time I had the Duplicator, with the upgraded version, it still did not do what they said it would. Peter Avalon did a review on both with equipment I furnished him and the Happy won hands down. I never received a refund for the Duplicator, as I had purchased two when they first started and sent them back for refund and they sent me 1 upgrade that failed every test. To date I have received nothing from them.

And this is your idea of a credible reference from the scientific
or engineering literature, eh?

I hope you'll understand if I'm entirely underwhelmed.

>The fact that you're still equating phosphor dots with pixels simply screams
>that you still don't understand what you're talking about. Unless you're
>dealing with a color LCD display, one pixel practically never equates to
>one phosphor group.

Well, so far all I've seen is a bunch of assertions and rather crude
ad hominem -- maybe some people find that sort of thing convincing,
but all it suggests to me is a lack of factual basis or understanding;
a singular lack of clue, if you will.

I am still interested in any credible info you might come across --
but please, no more of this witless pontification, presented as fact.

Meanwhile, I think I'll stick with my original statement: the Atari
use of the word "pixel" is pretty different than the typical
colloquial understanding of the term.

3.Bosconian (MSX)
4.JetPac (Spectrum)
5.Runemaster

>2) Which characters (i.e. Jet Set Willy) stick most in your mind.

Well I do remember Jet Set Willy....but not really a guy with
character....so I would me thinking more about :

Latok, Fray and Pixie (from the Xak RPG series)
Adol Kristin, Lilia (from the Ys series)
Joe Kowalski (Blow up!)
Solid Snake (Metal gear series)

>3) Forgetting 3d, Playstations, N64's and PC's, what updates would you make
>to old games. Would you improve the graphics for instance?

Yes I would, change the graphics, but carefully not to harm the
original atmosphere those games had....imagine what the original Metal
Gear would look like with a higher resolution and lighting effects.
And I would change the sounds too....

>4) Does anyone know who owns the rights to any old games or characters.

Well depends on which characters you are talking about, most
characters are still owned by the companies who developed them.

All characters from the XaK series (like Latok, Fray, Pixie) are
property of Micro Cabin co.,Ltd japan (www.microcabin.co.jp)

All characters from the Ys series (like Adol & Lilia) are property of
Nihon Falcom co., Japan (www.falcom.com)

Solid Snake is property of Konami co., Ltd Japan (www.konami.com)

JetPac is property of Ultimate Games PLC, which doesn't exist any more, but I suspect the game & characters are now property of the company that once WAS Ultimate Gaming, namely Rare Ware UK.

And RuneMaster didn't really have any specific characters, but the games from Compile are still property of Compile Co., A lot of ppl seem to think they went bankrupt (and they did) but they made a new start....

>Answer back soon

If there are things about old games or characters you would like to know from the legal owners, I could ask the contacts I have with those companies how things are....just lemme know.

> 1) If you could play any of the classic 8 bit games again what would
> they be. A top 5 would be good.

Does it count if I didn't actually stop playing them...? =-)

Okay, top five time, assume C64 for all of 'em...

1. Armalyte (Thalamus)
2. IO (Firebird)
3. Turrican 2 (Rainbow Arts)
4. Enforcer (Double Density)
5. Delta (Thalamus)

Briggsy:
> NetherWorld (Amstrad).

Nah, C64. 50FPS and that kick arse digi assisted tune on the titles.
=-)

Richard Wray:
> Which characters (i.e. Jet Set Willy) stick most in your mind.

Briggsy:
> None really. Games were the focal point back then, not characters
> (Lara Croft comes to mind). Of course, monty mole and Roland (CPC
> only) come to mind, but not to any great extent.

What about that ****ing egg? I may hate his yolk but Dizzy was a known
on most formats...

Richard Wray:
> 3) Forgetting 3d, Playstations, N64's and PC's, what updates would you
> make to old games. Would you improve the graphics for instance?

Briggsy:
> Of course. Definitely higher resolution and more colours. If these
> games are to be brought back as near copies of the original for the
> PC, Acorn, Amiga, etc, then higher resolutions are a must.

As an aside, Andy Roberts is doing a version of Mayhem in Monsterland
for the PC... =-)

> Updated sound as well would be cool. No MIDI though, it is worse than
> a Speccie 48k 1 bit beeper sound. Big fat chunking samples etc.

[Points at Briggsy]
With him, Screamtracker sound support, please. =-)

Richard Wray:
> 4) Does anyone know who owns the rights to any old games or
> characters.

Briggsy:
> No.

In most cases the characters are still owned by the companies in
question, Monty and Thing belong to Gremlin, Dizzy to the Codies...

But as for the copyrights on the games themselves, it gets *very*
complex in some cases... =-(

Yes, I agree. My all-time favourites are Joust and Time Pilot '84. Nothing really needs to be done to the graphics (though higher res would be appreciated), but native versions would be nice.

My "Silver Label" Version "A" cart still had a very tiny portion of the clear factory "Plastic Wrap" stuff emitting from around the outer cart's screw. Also, the label is absolutely MINT. For the foregoing reasons (and, I might humbly say, I have an EXTREMELY FINE eye for detail -- I am fanatical about such things) I am personally CERTAIN that my "Silver" cart had NOT been opened (except now, by me) since it left the factory.

That's a VERY astute and well-reasoned scenario. I believe there's an excellent chance that that scenario did play out with at least a few machines out there. For the aforementioned reasons, though, (see previous post) I remain convinced my cart had not been opened since the factory. I'd be foolish not to admit it's Possible that it happened to my "Silver" cart, but my meticulous observations of my cart tell me otherwise (but your scenario and theory are absolutely valid, plausible, and probably DID happen in several cases -- if the "socketing" and other compatibility issues would have allowed such a transfer).

The pinout was given. I have plenty of cables, so i do not
make them anymore, I just make adapters. Port 1 is the best for
general modem use. I disagree with the styatement that the Atari
9 pin is not RS232, it is, its just not IBM PC RS 232. It does
however date back to 1981.

John,
It's a Card that Plugs into the atari SIO Port and Lets you use
standard IDE Devices I.E. Hard Drives and CD-ROM's. It's a smart Device
in that it looks to the Atari to be a Standard Floppy Drive and can
function Quite well as such but for the most Flexibility Use Ed-Dos 2.0
which is a DOS i wrote Similar to Sparta DOS for full Fuctionality.
I've had this working for about 3 years now and IT WORKS.
I've never wanted to make it PD or Sell it, Nor will I ever I don't like
the support issues as well as the small customer base.
Just Like I'll never place the 256K 600XL Upgrade or even the Bit Mapped
cartridge Overlays that give me 1MB of Cartridge Swapable Memory.

I May post bit's of my projects at some point but not anytime soon/
Trust me the 6502 is a very nice processor even in the world of Pentium
II/III's

Thanks Ed
tchermok@flash.net

Also It's not Blazing Fast as it runs at SIO Speeds But it Works
if I could get CODE from someone on the High Speed IO I would
add that to my interface and Get maybe a little more speed....
the only reason i use the SIO is for compatibility I've
prototyped a version for the XL/XE Expansion Bus with a speed of
1.21 Mbits a sec but then you loose compatibility with the 1200XL/400/800

Thanks Again

The "gray" carts are very hard to open. I bought a $3.00 Necromancer (now listed as "Ultra Rare" on ebay) and took it apart (read broke it open.) Oh well, the black tape on its sides coordintes well with the gray!

F.S. as well as a couple others are bank switchers. Really tough to make a binary image of those, although I suspect that supporting bank switching could be added to emulators by having a dedicated space and using a pointer to switch "bank addresses".

>I really want to run a large BASIC program, I use revision
>C in RAM (I'll be damned if I'll reduce my 1mb upgrade to the equivalent
>of a 320k machine just for the sake of BASIC).

There is a sometimes advantage to Atari
Basic - the ABC compiler, but you still can
use it with a Turbo program if you don't use
any of Turbo's extra features. I personally
never much cared for the Turbo Compiler -
if only they had appended the run time to
make a stand-alone file.

Question - anyone using a large (512K or larger pgrade with the CSS Ultra Speed
O/S?
One of the features, I believe is it provides
an extra bank-switching bit for upgrades
so that you don't lose built-in Basic (?)

As far as I'm concerned, the Tomb Raider series is just Rick Dangerous
III,IV, and V, nothing more, nothing less.

That's a very good point. Turbo BASIC is really cool. But to answer
your question in one short word (well two really); maximum
compatability. I've been a Sparta junky for a long time but I
wouldn't be foolish enough not to at least have an Atari DOS 2.5 or
even 2.0 laying around "just in case."

Sounds like maybe your second joystick port may have a loose solder
joint on the appropriate pin(s). If not that, then check the (PIA?)
to make sure it is seated well in it's socket. Remove it clean the
contacts and re-insert.

I've an assortment of Atari 8-bit stuff I need to get rid of here in the San Francisco Bay Area. 2-1050 drives, 2-1200XLs (they work, but both have some keyboard problems - some keys don't seem to work), a color monitor, tons of software (I use to help out with an 8-bit club software library), and other assorted goodies. It's all or nothing, and it's gotta go (I just moved and I don't have room to set it up or store it). I don't want much for it, I mainly just want to see that it doesn't become landfill. Please email me if you are interested.

Not really....MGS was one hell of a game, but Metal Gear and Solid Snake were 2D birds view games...I would keep that intact, but add lighting and other effect possible on nextGen machines.....I guess the 3D engine with a 2D look Gremlin Int. used in Loaded would be the closest to what I have in mind.

Oh, I see what you mean. I downloaded Metal Gear:Solid Snake the other
day on an MSX emulator and it was pretty impressive, although all the
text was in Japanese of course, so I didn't get much of the storyline.

Interestingly (or not) enough, the frequency that Snake talks to the
General in Metal Gear:Solid Snake is exactly the same as that in
Metal Gear Solid.

Is that so amazing? The project supervisor (Hideo Kojima) was still the same guy.....I bet if Hiroyuko Fukui would still be working there there would have been some changes to MGS too....

But anyway, for an 8-bit game Solid Snake is really impressive, the detail levels, the size of the game and of course the brilliant music by Masahiro Ikariko.....and about the Japanese, we 'had' to play a lot of games in Japanese in those days....there is an English version of solid Snake available for the Emulator tho.....dunno exactly where.

Greetz,

Ruud.

ps. I finished Arc the Lad II, Final Fantasy VII and Metal Gear Solid on the PSX too...all in Japanese.....:)

As Steve Hickman (producer at Eidos) said...."in development, 90% of
all programmers being male, it's nicer to look at a female sprite then
a male one"

So why would that be sexist ? Nature may be admired....

Ruud.

It certainly is an impressive game. Maybe see if I can dig out the
English version from somewhere.

Sadly the MSX never took off on these shores (in the UK), so I didn't
get any exposure to these games back when they were released. I had
a Spectrum, which AFAIK didn't have anything like the stealth'em'up
of the Metal Gear games, although The Great Escape did come close in
parts.

Are you a masochist or something. :)

Unfortunately I've had to wait for the PAL release of Metal Gear Solid,
(seeing as how my TV can't handle 60Hz signals, so I can't play NTSC
games) which means I haven't actually got it yet! (This lunchtime's the
plan, as it's released today.)

Only the MSX1 had some popularity in the UK, Konami even had a UK development team back then (In Devon) but the only game they made (Green Barret) wasnt really impressive....a lot of UK based Publishers however wee active on MSX...like Gremlin (Avenger) US Gold, Grandslam, Domark (now branch of Eidos) and Ultimate Games (Knightlore, Alien-8)

I had a Spectrum too, but the games weren't really like anything the MSX had.....although I loved jetPac, Jet Set Willy, Cookie, Pssst and many others.

>Are you a masochist or something. :)

Nahh...I just wanna play the games when they are released.....and I am experienced in playing games wihout understanding the language...and I like the Japanese language too hehehe....

>sheeeeesh, when did ya buy that TV? In 1938? hehehehe NTSC rules

No. 1995 surprisingly. I didn't have a Playstation at the time, so
I wasn't specifically looking for a 60Hz compatible TV, and I didn't
end up with one. It's an excellent TV but it won't sync to 60Hz.

Anyhow, PAL's a better TV system than NTSC, with higher definition
and much better colour, it's just the 50Hz refresh rate that's the problem
when developers do shoddy game conversions.

Thankfully Konami have spent the time well on Metal Gear Solid, judging
by the four area demo I've played (it stopped after you'd talked to
the DARPA chief), as it runs full screen with no slowdown.

Hmm, the very cheap Samsung TV my father bought in 1995 could even
handle NTSC... I have my MSX2 on it...

Oh, and the English version of Metal Gear 2: Solid Snake can be
downloaded from:
Komkon FTP:
ftp://ftp.komkon.org/pub/EMUL8/MSX/Carts/KonamiSolidSnake-Eng.rom.gz
Information about the Translation and ROM/DSK versions:
(Maarten ter Huurne's pages:)
http://www.stack.nl/~mth/msx/solideng/

Glad to be of help! Have fun playing the English version! I finished it,
and it's superb!

Yep, mine was quite an expensive Philips 14" TV, but it'll only handle
50Hz.

Cheers, although I've just bought Metal Gear Solid, so Metal Gear 2 might
have to wait.

The bank is liable for any chargebacks issued against a merchant, so a merchant is approved based on the type of business, length of term in business, return and service policies, average ticket, annual volume and the creditworthiness of the company owners. Keep in mind also that most major banks do not take mail order merchants, since mail order presents a much higher risk than walk-in traffic.

Ben, if you want a credit card merchant account, please give us a call at (800) 774-6462.

Do you know if the version of MAC/65 compatible with MyDOS? I've used
it with the DOS-XL that comes with it, but not had too much joy with
MyDOS.

"Suz" wanted to know about the PS3000 Monitor

Suz, if you searched the web like you stated, you didn't look hard enough. I quote directly from my Atari web site:

The PS-3000 was designed for use on the ST series of Atari computers. I'm lucky to have one myself. They are pretty rare. A limited amount of them were sold through the Federated chain of electronics stores shortly after Atari bought Federated. To the best of my knowledge, that is the only place where you could buy them.

The monitor itself was made by JVC. It is a 12 inch monitor capable of displaying low and medium resolution color video.

The floppy drive is a single sided 360k 3-1/2 inch model. It is pretty useless by the standards ot today. The drive is more-or-less the same as the Atari SF354 drive. I'm told that it can be upgraded to the 720k double sided drive, but you will need to do some major hacking to make it work.

Since you don't have a power supply, you will need to find the one that is specific to this model. The power supply for the PS3000 isn't your standatd Atari power supply. I believe Best Electronics sells them for about $90

Ri> I have a few simple questions for all of you.

Ri> 1) If you could play any of the classic 8 bit games again what would
Ri> they be. A top 5 would be good.

This is list of Atari Classics I still play and enjoy:
1. Protector I and II
Great gameplay, terrific music, very addictive,
you keep saving those people.
2. Astro Chase
Great graphics, good music, love it.
3. Galaxian
A real classic shoot'em up. Got some nice artificial intelligence.
Terrific tune which you got to love.
4. Defender
Simple graphics, but great gameplay. Once you play it, you re hooked.
5. Jet Boot Jack
Outstanding gameplay, graphics and tune. Real stunning.

And of course I could go on and on and on.
How about Moon Patrol, Pacman (the all time classic), Pole Position,
Caverns Of Mars, Eastern Front, Miner 2049-er, M*U*L*E (definetly),
ok, ok, I ll stop now...

Ri> 2) Which characters (i.e. Jet Set Willy) stick most in your mind.

Bounty Bob.

Ri> 3) Forgetting 3d, Playstations, N64's and PC's, what updates would you
Ri> make to old games. Would you improve the graphics for instance?

Making use of the expandable memory (up to 1 MB),
or the possibility to make use of new devices like CDROM, etc.

Ri> 4) Does anyone know who owns the rights to any old games or
Ri> characters.

Maybe if you would refer to a specific game, it would make things easier.
;)

Ri> Answer back soon
I just did... :)

Bo.

Get a grip! GOD what an anal retentive beast you seem to be. Witless pontificating? Sheesh! IIRC, you used engineers for a ref. In order to qualify your engineers, you should have made it a two part question:

Is the cathode positive or negative?

Followed by

What is a pixel?

The shouldn't get a chance to answer question #2 if they miss question #1.

I have worked with literally hundreds of engineers, I don't take their definitions as gospel. If they told me the sun was up at noon, I would loot out the window to make sure.

Here, Herbert Schildt writing in Turbo C, The Complete Reference.

The smallest user addressable part of the screen in a graphics mode is one pixel. (Actually, the term pixel originally referred to the smallest individual phosphor element on the video monitor that can be individually energized by the scan beam. However, in recent years, use of the term has been generalized to refer to the smallest addressable point on a graphics display.)

A pixel is a screen addressable point. The terms are interchangeable.

Herbert is both well respected in the computer industry & I have found him to be a pretty nice guy. He has written numerous books on programming & is probably one of the best selling authors of tutorials in the field.

But I kind of fully expect you to say he is not a credible source.

Making the image is really not hard--you just keep switching banks and dumping the ROM to disk files (sequential extender sort of thing). The real challenge is in using the images and emulating some sort of equivalent to bank switching.

I have never used, and never plan on using, a BASIC compiler. If I'd wanted to use compiled languages on the A8, I'd have kept the Action! cartridge. To me, BASIC is nothing more than a quick and dirty utility an calculator. I think the longest BASIC program I've written in years was about 20 lines (usually something to manipulate files to and from the RD or to compare assembled disassemblies with the original. I do agree that one of the best ways to use Turbo is to stick to Atari BASIC syntax.

The disk versions probably have to be used as an autorun with MYDOS (I know they do with other two-part FMS). You might get away with using the "Load MEM.SAV" option with the disk version. The cartridge will work with just about any DOS you can dream up.

The problem with using MYDOS with MAC/65 is that you lose the batch file capabilities that can enhance its usefulness. For example, with my OS disassembly I often will run a Sparta batchfile to successively enter each of about 20 source files, replace a label, save the file in straight ASCII as well as tokenized M65, and finally, assemble the whole thing. That just can't be done with MYDOS.

John

BTW, I was thinking of emailing you with regard to swapping some source code just to see how we each handle RD coding, etc. Let me know if you're interested.

No not really, the games had similar feel alright but as they were programmed by the same team, it's hardly lifted, how do you nick something from yourself!! Borrowed perhaps, but when the donor is as good as S.blade on the GX4000 I'm not complaining if you can play the same type of game over different mazes and levels.

Please direct all replies through E-Mail to bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I do not regularly read NewsGroups.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/ Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

You do ? Well....first of all, the in-game Lara Craft is not a 3D
model, it has been modeled but the in game Lara is a polygon based
sprite....(there is that word again). But you are right, in a lot of
times the word sprite is inapropriate.....objects would be a better
word, but since a lot of ppl in bussiness now also worked on those
nice 8-bit thingies like the MSX or C64 where all moving objects WERE
sprites.....guess you just keep referring to that word....

Now we COULD start a brand new discussion here about using names like
spites, objects and so on....but what the heck....you got the meaning
didn't ya ?

Hmm, but surely the coding was so damn similar, Gremlin must have been
a little narked at it being practically re-used in the Codies game?
Also, I found Stryker to be vastly inferior to Switchblade, although it
used colour better, that's for sure.

But sprites were so-called because they 'floated' across the screen
without interfering with the background. Lara is bitmapped onto the screen
by the program. With sprites you could just say 'move LARA' and the
mapping would be perform at broadcast time by the video circuit. Lara does
a 'move LARA', 'redraw SCREEN', [broadcast].

SO why did you think I said that often enough the term sprite is not
apropriate, of course Lara is bitmapped, like with every PC game the
moving things are bitmapped.....nevertheless because they are USED and
BEHAVE like sprites we all still call em that.......call me
sentimental ;)

Randy Glover was the man behind Jumpman... I believe when he showed it
to Epyx it pretty much made his career with them. Up until that point
Epyx was just publishing games written in Basic like 'The Nightmare'
and the popular 'Temple of Apshai'. After Jumpman most, if not all, of
their stuff was written in assembler.

And, I agree with the others that Jumpman was an outstanding title.
The control of the character was far better than Miner 2049er (and was
similar to Mt. King). They were all a lot of fun to play. Jumpman had
more to it in terms of levels and music, though, due to its disk based
nature.

SSSS tt ee ee ll ll aa
SS tt eeeeee ll ll aaaaa -- "An Atari 2600 VCS Emulator"
SS SS tt ee ll ll aa aa
SSSS ttt eeeee llll llll aaaaa

================================================================================
Release 1.1 for DOS, Linux, and Unix
================================================================================

The Atari 2600 Video Computer System (VCS), introduced in 1977, was the most
popular home video game system of the early 1980's. Now you can enjoy all of
your favorite Atari 2600 games on your PC thanks to Stella!

Stella is a multi-platform Atari 2600 VCS emulator written in C++. Stella
allows you to play most of the games written for the Atari 2600 including
Supercharger games.

This is the 1.1 release of Stella for DOS, Linux, and Unix. Distributions
for other operating systems will appear as they become available. The three
distributions currently available are:

* Binary distribution for Linux (stella-1.1-linux-x86.tar.gz)

* Binary distribution for DOS (st11.zip)

* Source code distribution for Unix and DOS (stella-1.1-src.tar.gz)

A few 2600 ROM images, BIN files, are included with these distributions.
BEYOND THESE FILES NONE OF THE DISTRIBUTIONS CONTAIN ANY 2600 ROM IMAGES.
PLEASE DON'T WRITE ASKING FOR ROMS BECAUSE THEY ARE COPYRIGHTED! If you
own any of the Atari 2600 Action Packs by Activision you can use the ROM
images from them with Stella.

New in this Release
==================

* DOS and Linux versions support real Atari 2600 paddles using a
special PC game port adaptor

* Linux version uses the new 1.2.x joystick driver API

* Added support for the "-display" option to the X Window version

* Added support for private colormaps to the X Window version
```

* Fixed a few bugs in the Supercharger emulation

- A major bug in the ROM loading routine was fixed

- Multi-loading in "Escape from the Mindmaster" works correctly

- All Supercharger games load and execute at this point

* Added a small hack to the TIA code to fix a display problem in "Escape from the Mindmaster"

* Improved TIA emulation to support the RESPx multi-sprite trick

Distribution Site
==========

The Stella distributions can be obtained from the Stella home page at:

I have 5 titles that get the once over pretty much every week.

Jumpman
Spelunker
Bounty Bob
Fractulas
Star Raiders

These *are* must play titles that every Atari 8 bitter should play at
least once :)

I have an Atari Portfolio for sale. I have the Card drive and
software, a 128 KM Memory Card and a Smart Parallel interface.
The Parallel Card and the PC Card Drive are packaged in the
original boxes and complete with instructions.

I am located Alsdorf, Germany - Please e-mail me direct
with offers -> mailto:leo@ppcom.de

2543. Video Tittler Software

Newsgroup: comp.sys.atari.8bit

Anyone know if video titling software was ever available for the 8 bit?
What with a video output and all, it would be a snap!
Gary

Are you using a monitor or a TV? On monitors, the light gun might not work depending on which output you use - one feeds properly to the lightgun, while the other does not. (I forget which is which, as its several years since I sold my lightgun).

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

I have a odyssey 2 with the box, 2 joysticks (working), power supply, and 5 games. The box is in good shape with wear on the edges.

The games are:

Speedway/Spinout/Crypt-Logic with box and instructions
K.C. Munchkin with box and instructions
Cosmic Conflict with box and instructions
Alien Invaders
Pick Axe Pete

I am looking for something particularly rare for the Atari 2600 that I dont already have. The list of things I own is at

http://www.msu.edu/user/reicher6/2600.txt

Tempest

2554. Atari 5200 and some Scratch and dent 2600 games for trade

Newsgroup: comp.sys.atari.8bit

Cross-posted to: alt.atari.2600,rec.games.video.classic,comp.sys.atari.8bit,rec.games.video.atari,alt.atari.2600.vcs

I have some rare Atari 2600 games for trade, but they all have various problems. Therefore, I'm not looking for aything too rare in return, maybe some Sears games I dont have or something like that.

I also have some 5200 games (in good condition) for trade.

My list of games I own is at

http://pilot.msu.edu/user/reicher6/2600.txt

Here are the games

Sea Hawk (label spotty and name on label)
Krull (holes punched in top corners of main label)
Taz (holes punched in top corners of main label)
Sorcers Apprentice (spotty label and small tear on end label)
Sorcers Apprentice (Mint condition)
Pigs in Space (spotty label, faded)

Atari 5200

Q-bert
Countermeasure
Pole Position
Pac Man
Space Dungeon
Defender
Qix (x2)
Star Raiders (with instructions)
Centipede (with instructions and box)
Ball Blazer (complete)

Catalogs

Spectravideo - meet the challenge vol II 11/83 (shows Galatic Tatic)

Bob, do you have rights to SpartaDOS X? I have an old ver. 4.2 ROM in
mine. If it were very reasonable I might consider getting it. 4.2
seems to work fine and now I use the PC mostly so I reasonable cost is
a must for me.

2559. Atari Light Gun?

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-28 00:00:00 UTC
From: Bowling <mbowlin1@tampabay.rr.com>
Message-ID: <EI3C2.3942$NU.2785363@newse3.tampabay.rr.com>
Source record: 54275

I was happy to find an Atari Light Gun. I plugged in my Bug Hunt, plugged in my Light Gun...and...nothing. I noticed that at the very back of my Light Gun (i.e., opposite the tip of the barrel, the end nearest me when aiming gun), there is a recessed "hole" (it looks like there are screw "threads", where something might have screwed inside). Inside this "hole", I shined a flashlight and there seems to be a metal "rod" filling the hole. Can someone tell me if there is something missing from my Light Gun? I tried the Gun on each of the FOUR gameports on my Atari 800, so I covered that base. Bug Hunt DOES run on my 48k "800", because it ran fine when I run it with a joystick only (although, as we know, the Light Gun is required to play the game properly).
Any thoughts are GREATLY appreciated!

Hello everyone,
Anyone know of a way to UNarc files downloaded to a pc? Is there a utility somewhere? I want to do this to try out files with the 800 win Emulator. Otherwise I guess you have to Null-modem the file to 8-bit, unarc it, then null-modem it back, somewhat of a pain. Fell free to E-mail responses, thanks.

There are numerous PC utilities to unARC files. I generally use arc.exe
(the original from SEA) because it can both compress and extract files as
well as view contents, etc.

You can find such utilities in the UMich archive and one of the easiest is
Simtel net. I don't remember the complete URL but http://oak.oakland.edu
will get you into the ballpark.

2567. Classic Gaming Expo '99!

Newsgroup: comp.sys.atari.8bit
Date: 1999-02-28 00:00:00 UTC
From: Sean Kelly <skelly@xnet.com>
Message-ID: <7bb6sv$61e$1@flood.xnet.com>
Source record: 54283
Cross-posted to: rec.games.video.classic,rec.games.vectrex,alt.atari.2600,comp.sys.atari.8bit

Classic Gaming Expo '99 set to roll!

The premier Classic Gaming event of the year has been scheduled for Aug. 14th and 15th, 1999 at the Plaza Hotel in Las Vegas. John Hardie and Keita Iida, two of the people responsible for last year's World of Atari show, have developed Classic Gaming Expo '99 so that it will appeal to all classic gamers, not just people interested in Atari.

Keita and John have teamed up with veteran collectors Sean Kelly, Les Caron, and Tom Keller, as well as notable industry alums, Jerry Jessop and Don Thomas Jr. to help bring CGE '99 to life.

The official show website is now up and running at: www.cgexpo.com From here, you can find the latest info about the show, including discount travel info, admission ticket ordering, latest calendar of events, and a list of industry veterans who will appear.

Some of the highlights of this year's show include:

- 21,000 square feet of convention space (3 times the amount of last year).
- Giant museum filled with rare and unreleased classic gaming hardware and software.
- Loads of coin-op games available for play.
- Game tournaments (Warlords, Tempest Duel, etc)
- Various game stations set up for play.
- Major corporate sponsorship and presence from companies such as Hasbro, Imagine Media, Nyko, Telegames, and Namco.
- Videogame auction that DOESN'T feature prototypes with $500 starting bids.
- A swap meet (tentative at this time)
- Continuous keynote speeches by industry alumni throughout both days.

There are currently over 30 industry veterans scheduled to appear at CGE '99 with many more in the works. Check out the webpage for a more complete listing, but expect to see the likes of Nolan Bushnell, Ralph Baer, David Crane, Steve Cartwright, Garry Kitchen, Rob Fulop, Dennis Koble, Tod Frye, John Harris, Jay Smith (who has said he will bring his color Vectrex), and many more.

>SIO2PC, automating the process
Maarten,

The things you need are: the SIO2PC hardware, and a program named A.P.E,
which is an Atari Peripheral Emulator, which is Shareware...

A.P.E. has many features, is able to emulate 8 atari-diskdrives at once,
with a max. of 16Mb per drives, which is the Atari-DOS-limit, not the
APE-limit...
You can also use APE to use your PC (internal) modem, and connected
printer. Use MS-Dos to run APE to avoid com-port timing-problems. If you
have a real fast Pentium, you may have luck to run it in a dos-box, but my
Pentium-75, 72Mb, is too slow to do it...

APE has an included utility to config the settings on the Atari, and
has CLI-commands to start-up, so virtually, you can use APE without even
having a keyboard or monitor connected to the PC, after setting-up
ofcourse...

It does even run on my ATARI 576Kb, 8086, 12Mhz XT-computer!

With APE you can also read directly from the PC harddisk without having to
use .ATR-images. In the registered version you can also write this way,
except with Sparta-Dos (PC-Mirror)...

Sysop Fox-1 (fox-1 AT aq DOT nl)

Gateway: THUNDERDOME, Atari 8-bit BBS. Running on ATARI 130XE. (Pro-node 471)

>referred to here? Has my 850 gone bad? How can this be checked?
>
> Thanks,
>
> Doctor Clu

It wants the 850 interface handler. This loads right after DOS loads. It can be found on the DOS 2.0 disks. I don't think it came with DOS 2.5 At any rate, I do this quite a bit - only with a PC to atari 850 interface. If you turn up the volume on the TV, you can tell when the handler loads - it is a different pitched sound. The cable pinout is below, but it might be skewed because of the line length. If you need it, email me.

Directions for making a null modem cable.

IBM ATARI 850 INTERFACE
25 pin 9 pin 9 pin

```
8 ------ 1 RLSD ----q--------------------------------- 1 DTR
6 ------ 6 DSR ----^ JUMPER TO (IBM RLSD)
3 ------ 2 RX ------------------------------------- 3 TX
2 ------ 3 TX ------------------------------------- 4 RX
20 ------ 4 DTR ----------------------------q-------- 2 RLSD
JUMPER TO (ATARI DSR) ^-------- 6 DSR
7 ------ 5 GND ------------------------------------- 5 GND
4 ------ 7 RTS ------------------------------------- 8 CTS
5 ------ 8 CTS ------------------------------------- 7 RTS
```

QMODEM ON THE IBM WORKS OK - AMODEM ON THE ATARI WORKS OK, HOWEVER, LIMIT FILE TRANSFERS FROM THE IBM TO THE ATARI TO 2400 BAUD. THE 850 OR AMODEM CANNOT KEEP UP WITH FASTER BAUD RATES. FROM THE ATARI TO THE IBM THERE IS NO PROBLEMS UP TO 9600 BAUD (LIMIT OF THE 850)

PCTOOLS, V 6, THERE ARE NO PROBLEMS FROM THE ATARI TO THE IBM AT UP TO 9600 BAUD. LIMIT SPEED FROM THE IBM TO THE ATARI TO 1200 BAUD WITH THIS SOFTWARE.

GARY

Rev B was indeed only in XL computers. You were supposed to be able to take the ROM from a "C" cartridge, and install it in the XL. I tried this even tho I had to unsolder BOTH ROMs. When done, the basic would not boot on the XL. I unsoldered and reswaped the ROMs to their original location and they both still worked.... I have 2 basic cartridges, both of wich came direct from ATARI, and both are the "C" carts. Both are also 1 chip carts but the boards inside are different - 1 is pink, the other is green. The green one has a diode which in not on the pink board. Hope this helps. I used to write a lot of basic stuff, and so needed the "C" cart badly. I also used turbo basic to RUN ATARI BASIC programs (it was faster), and even compiled a couple of them with the built in compiler (then they were REALLY fast)
Hope this helps solve the confusion.

Gary

2574. cartridge switching method (was Re:Cartridges)

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-01 00:00:00 UTC
From: macfalkner@aol.com
Message-ID: <19990301080528.21774.00001056@ngol01.aol.com>
Source record: 54193

Hi all !

Im asking for some special hardware infos about the switching method of cartridges >8/16KB. (switchregisters/adresses/bits etc.)

I want to upgrade my AFLOS (Atari Flash OS) for emulation of bankswitched cartridges like OSS (Mac65 etc). I have read about some other cartridges (with another switching method) in the 'cartridge' thread. Can anybody tell me the name/manufacturer of such carts (some of that), how big that are and how this other switching method works? Perhaps its possible to emulate more than the OSS bankswitched carts with an acceptable expense.

I will release the collected infos on my homepage.

Thanks in advance,

bye, MacFalkner

The Pooldisk Too CD is a double CD. It contains about 5000 ATR files
on one CD, while the other CD is filled with internet pages, pictures
of equipment and peripherals, scans of artwork on packages and
cassette inlays, text and information files, which includes the
scanned text of "Mapping the Atari" (used by permission)
various PC utilities and ST and Macintosh stuff that can be used to
get the most out of you Atari 8-bit. Of course several emulators are
on the CD too.
The ATR files contain a very large portion of the ABBUC PD library,
the complete SAG library, the complete Bellcom PD library, the
complete SCAT PD library, The Lace library, and large portions
of the HAPS library, the Twaug library, C&T, SPACE, Colonia,
Analog, Page 6, the Futura magazines, TOP magazines,
POKEY magazines, Mega magazines, and several other sources.
There are more than 6000 ATR files on the CD, but some
libraries have disks that other libraries carry too, so all in
all there are about 5000 different disk images.
All in all, way to much to list.
You can find some more info at:
http://www.xs4all.nl/~stack/atarixle.html
of for Germany
http://www.atari-computer.de/abbuc/

I know there are some other CD's out there.
Just search deja news and you are bound to find something.

Keep those XL's/XE's humming
Ernest.

> --Mark

It's 9 Volts, AC, so it's just a transformer. It may have a fuse. I
recently fixed one from a 1200XL- the fuse wasn't blown, but it was
resistive and was dropping the voltage so much the 1200XL wouldn't work.
I had to cut the case open because it is glued together, jumpered around
the fuse, and taped it back together. I got a floppy drive, which used a
similiar powersupply, and I noticed it had already been cut open and
glued back together, so I guess it isn't unusual. Someone just posted a
url to the specs on all these powersupplies the other day, and I noticed
that there were several variants, some put out more current than others.
I noticed the supply for the disk drive was more powerful than the one
for the 1200XL, so it could power the 1200xl but not vice versa.

2593. Atari 800 XL

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-01 00:00:00 UTC
From: Bret Kellihan <blk3z@virginia.edu>
Message-ID: <36DAD959.3D49F94C@virginia.edu>
Source record: 54212

If an Atari 800XL is functional (will play carts) but won't boot the internal basic, would it be possible to load basic from cartridge? I'm aware that this is probably a damaged basic rom and just needs to be replaced. Someone offered a good deal on the machine, and while I can't replace the rom at present, I would still like to use it. Would poping in a Basic cartridge (Atari 400/800) work?

thanks,
bret

2594. 800 xl basic (again)

Newsgroup: comp.sys.atari.8bit

Source record: 54214

I have booted both of my 800XLs and my 130XE with the original Basic cart.
with no problem however I have never used the cart with these machines. I
was just curious to see if the machines would boot.

I used to use my REV C cart in my 800xl and all the time when I was writing
basic code. It worked fine here.

2597. Another 800 XL question

Source record: 54217

Generally not. Most of the carts (esp Rev A) used two ICs; the XL
motherboard only has one socket. I'm not sure of the pinouts either.

The 400/800 OS ROM was in two 4K chips and one 2K chip (the floating point system). You'd have to copy the three chips and then burn a 27128 EPROM to replace the XL OS. You'd also lose the PBI (MIO & BB).

On the plus side, there's a lot of real estate left over in the EPROM, and you could install some nifty additional routines (omnimon, anyone?)

2603. 2600 wireless/remote JOYSTICK:for VCS/5200??

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-01 00:00:00 UTC
From: Jimbo <jimbo_116@hotmail.com>
Message-ID: <OcjveV7Y#GA.214@upnetnews05>
Source record: 54287

Does anyone know if you can safely connect the 2600 wireless remote control joysticks to the Atari 5200 via the VCS cartridge adapter? Apparently you ordinarily connect the power cord from the receiver unit to the input jack on the 2600 console, then the 2600 AC power adapter to the input power jack of the receiver unit. Will this work using the 5200 (2-port) power adapter to the receiver input jack, then the unit's power cord to the back of the 5200, controller cables to the VCS adapter??

Thanks for any help.
james

I remember (for those from the UK) walking into Silica shop and seeing
Miner on display, god that was a great sight.

And thinking about it on those saturdays, the chorus of sounds you heard
as you walked in, some Pacman from the right, some Star Raiders from the
left, "We gotcha" coming from the person playing Tumblebugs and the
sweet sound of a real 810 merrily loading games :)

Ah, those were nice days :)
>
>Spelunker pushed that formaty forward more, and things like loade runner's

Spelunker just has a wonderful draw to it, many people replay this game
over and over. Also I would have said Crystal Castles was a better
isometric game (LR was a clone tbh)
>
>I'm still waiting for the mame color fix for spelunker arcade, BTW...

I actually use a slightly modified 800 rom with my multi OS board from
Newell(?). Its a fantastic little board that has OmnimonXL plus 2 spare
sockets for any other OS chips.

Good knows if they still are available, if they are then get one
instantly along with Omnimon (a real must have if you are into coding)

There are also translator programs available which will install Charles
Marslett's Fastchip floating point routines and add the $C000-$CFFF range
to free RAM when installing the 800 OS in RAM. I can't get at them right
now because of 8-bit problems but you might find them on UMich.

Hi Bret,

>Another extension then.... Assuming I replace the 800 XL's rom with a burned
>400/800 OS rom....

This is certainly possible, but not IMHO desirable. Best to stick with the XL
OS.

>....would it still be possible to replace the on board BASIC....

The on-board BASIC is in a seperate ROM to the OS, you can replace it with ANY
cartridge ROM you like as long as it's an 8K ROM and has the right pinout (my
memory is a bit hazy after all these years but ISTR that the pinout of the
BASIC ROM is not the same as that of a 2764 - difference in chip select
polarity?).

>....have it auto-load, or would that capability be lost with XL-OS?

Most probably you'd lose that capability since the OS will not know how to
control the inbuilt ROM. It will set port B of the 6821 to be all inputs when
initialising the hardware, so unless the CS line of the BASIC ROM either floats
high, or is pulled high by a resistor, the ROM will not be seen by the
system....

[LATER]

I've dug up my 800XL schematic....you would definitely lose the built in BASIC.

Bit 1 of Port B of the 6520 (6821) is used to control whether the built in
BASIC ROM is enabled or not. Since the 400/800 OS would set this port to input
mode there will be no output on this line which will then be pulled high by a
3K resistor, disabling BASIC since the line is active low.

You're fine as far as the built in OS is concerned since the line is active
high (and pulled high by another 3K resistor).

BTW The BASIC ROM appears to have the same pinout as a standard 2764 (OS is
27128).

TTFN - Pete.

This probably falls into the category of "if you have to ask, you can't afford it", but does anyone have any knowledge of what these sell for when they change hands? I'm sure this doesn't happen too often, but it sounds like there's enough of these in existence that every now and then, one must be sold..

>
>So long,
> Thomas

Well, I can think of a few things. I know it can be done in software, but
I'd like to do it once and be done with it.

The problems I have are the following:
1) No translator disk
2) I usually won't have a disk drive on this system.
3) That's going to be a pain to load it every time, when I'd like it to
be permanent
4) I'd rather just modify the hardware than patch it up every time the
system starts.
It would probably take 15-20 minutes with a soldering iron to fix it
up permanently.
Since I'm already looking at replacing the onboard Basic ROM (I think
it burned out.
Although I'll be using a cart for a few weeks, I'd rather have basic
on-board). so I
could just swap out the OS-ROM at the same time.
5) Loading the OS into RAM eats RAM... if this was a Pentium II with
128Meg of the stuff
sitting around, it wouldn't be a big deal... But with a disk drive
and the translator
disk, DOS has to be loaded, and the OS has to be loaded from the
drive... that's too much
waste in 64K ram...

I have the ROM images for the Atari 400's OS. I'd just like to burn it onto
a chip and pop it in...
```

Unfortunately, I don't have a burner. If anyone could make me an EPROM with that data burned into, that would be great (contact me if you'd be willing to, I'd be willing to pay to have the chip burned). blk3z@virginia.edu

Thanks,
Bret

Hi Pete,

Thanks for the info. That's more like what I was hoping for. :) Do you
think it would be possible to tie in a resistor to a switch and mount it on
the case. Then tie the resistor to the onboard power supply and use that to
pull bit 1 of port B high to enable the onboard basic? That way it could be
turned on and off from the switch?

You have schematics of the 800XL?? Where could I find a copy of those?

Thanks,
Bret

I bought a program from Ben two years ago.

I thought the service was average. I didn't think the product was working, and when I tried to get answers, they weren't forthcoming. To say the least, I was a bit nervous about the deal.

It turns out the problem was on my end. I figured out where my mistake was, on my own, and I got it working.

He had what I wanted. He sold it at a fair price. He shipped it out in a timely manner. He did not provide service after the sale, he went very quiet.

That is my review of Bravo Sierra. I would consider doing business again if there was a special reason, so far I haven't.

I had the same problem with my 800XL back in 1984, and while waiting for a new Basic ROM, I used a Basic Cart (can't remember the revision) from a friend's 400, without any problem.

I think part of what people are forgetting, is that these were the first real platform games.. Jumpman made it because of the levels, and the addicting animation and music.. miner (and bounty bob) made it based on precision.. you had to be GOOD at miner to beat it.. timing is everything!

Spelunker pushed that formaty forward more, and things like loade runner's rescue pushed thatenvelope even further (and it was isometric, AND had a level editor!)

I'm still waiting for the mame color fix for spelunker arcade, BTW...

Thanks David,

That sounds like a plan ;-) Now all I need is a trusty eprom burner and a copy of the images ;-) I wouldn't mind losing the PBI in exchange for the 800/400 compatibility.

Another extension then.... Assuming I replace the 800 XL's rom with a burned 400/800 OS rom, would it still be possible to replace the on board BASIC and have it auto-load, or would that capability be lost with XL-OS?

Since the 800 Os can be loaded into the RAM under the ROM, where's
precisely the problem? All this can be done in software!

Again: Why not doing this in software? There's enough Ram in the 800XL
to load the basic code from disk, and even reset-protect it.

No, but you can use the Translator disk which basically loads the
400/800 OS into RAM on the XL.

Hi,

I had found 3 sets of tape game for XL/XE Alienbusters by Blackfire!

It's 3D action game and ex.rare (collectors item), one of the best ever released.

Now for sale, documents and box included, excellent condition.

Please, offer by e-mail.

[This is my second post on the subject. (I cancelled the first
because of a factual error.) If you see this twice, my apologies.]

This has already been done, at least twice I'm aware of.

CSS (www.nleaudio.com/css) has their Ultra Speed Plus OS, which consists of three OSes in one; the standard XL/XE OS, the 400/800 OS, and the Ultra Speed OS, which is an XL/XE OS with built-in high-speed floppy routines, ramdisk handlers, and a reversed OPTION function when booting with/without BASIC (as well as a few other goodies). I don't know if Bob has any of them available at present, but the list price on them is $69.95. I have one installed in my power 800XL, and I just love it.

Also, Steven Tucker, he of APE fame, advertises his APE Warp+ OS on his Web site (www.nacs.net/~classics/apeos/index.html) which sports many of the same features as the Ultra Speed Plus. Steven's list price is $49.95 or $79.95 installed.

There's probably others I'm not aware of, but given the fact that these products exist, I'm not much of one for reinventing the wheel - particularly since you'd spend a lot more money just to get hold of an EPROM burner.

I have dealt with Ben Smith on about 6 purchases over the last 3
years and have been very impressed with his professionalism and
speedy deliveries. He also has given me free items on two occasions
when he wanted to be rid of them. In all honesty, I believe he is
one of the best small business operators I have ever dealt with.
I usually get the items I ordered in only a few days. Try comparing
this to ICD! I currently have been waiting since Sept. of 1998 for
my link 2 to arrive and still no response -- I've even talked to the
owner several times on the phone to no avail. You will never
experience this type of poor customer service with Ben.

Only one candidate for #1: M.U.L.E.

I'd like to see the gameplay expanded a bit, and a few more options
added, longer games. The memory of the 8-bit systems was probably the
limiting factor there.

Prettier graphics wouldn't hurt, but the gameplay was so good it made
up for any lack of eye-candy.

From: Jason Compton <jcompton@xnet.com>
Message-ID: <7bie8c$7te$1@flood.xnet.com>
Source record: 54154

Bowling <mbowlin1@tampabay.rr.com> wrote:
: Does either Commodore model have advantage(s) over the other one? The C64,
: or the (whiter, and larger, I think) C64c? I am considering buying one of
: these, mainly for game playing.

The differences are minor. The 64C has a more comfortable keyboard, but
the "bug-fixed" audio (SID) chip actually causes certain games (mostly
that use digitized sound) to sound muffled. They're cheap, get both. :)

2639. Keyboard troubles with my 130XE

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-03 00:00:00 UTC
From: Wim Kuilman <W.Kuilman@TA.TUDelft.NL>
Message-ID: <36DCF608.4FE726F3@TA.TUDelft.NL>
Source record: 54155

Hi,

Last time I used my 130XE, I poured a cup of coffee down the keyboard. Not a big problem I thought, so I unscrewed the keyboard unit and cleaned it with (blush) an aggressive cleaning detergent. It removed the coffee all right, but also the conducting material on the foil. So after that mishap, the keyboard stopped working all together :-(Has anyone have any idea on how to get my machine working again? Are those keyboard units still for sale somewhere? Can I attach one of those cheap PC keyboards to my Atari?

Regards,

Wim

look at: http://members.aol.com/MacFalkner

theres a plan to build an AKI - Atari Keyboard Interface to connect a PC
keyboard to your atari. Perhaps i will have some complete AKIs (selfmade) for
the atari fair at Schreiersgrï¿½n (march 20).

bye, MacFalkner

Message-ID: <JAbD2.12933$po.5239@c01read02.service.talkway.com>
Source record: 54161

Greetings.
I have 2 atari 410 units I need to get out of the closet. I took one apart and cleaned it but the main drive belt was loose and the counter belt was broken. I left these off when I put it back together.
The other also has a loose main belt but I left that one on. It's also a very clean 410. The other is off color :)
For sale real cheap. Cost of shipping plus 1 dollar or trade for 2 common cartridges like basketball and qix.
Thanks
Mark

From: clark@pwrh.com
Message-ID: <7bk7s0onq1@nnrp1.dejanews.com>
Source record: 54166

I have a legal version of Temple of Apshai for my Atari 1200XL that I would love to play on an emulator on my PC. I have found several disk images for the C64 but nothing for the Atari. I know there are some complicated ways to connect an Atari computer to a PC, but I was hoping to avoid that. I also did not want to go through the effort only to find some odd copy protection. I was wondering if anyone knows if a disk image is available for the Atari version, or if someone has created their own. I would be willing to "prove" that I own a legal copy by photocopying any portion of the manual, the box or the disks.

Thanks for any help,
Michael

2651. Atari 410 Problem

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-03 00:00:00 UTC
From: Bret Kellihan <bkellihan@earthlink.net>
Message-ID: <7bkaok$g04$1@murdoch.acc.Virginia.EDU>
Source record: 54167

I have been having some problems loading Cassettes on an Atari 410. I have gotten the following errors:

ERROR- 21
ERROR- 140
ERROR- 143 AT LINE 0

Is there a place where I can find out what these mean? I've take a blank tape, written a little program:

10 PRINT "HELLO"

and CSAVE-ed it. Then I turned the computer off and back on... then I CLOAD-ed it just fine, so I'm assuming the recorder is functioning ok. I've also played the computer tapes (Commercial) on my stereo and sure enough, they are computer files.... Any ideas? Are they just that old that they will no longer load?

thanks,
bret

>thanks,
>bret
Error 21 means that the file is not a BASIC save file. Try booting
the tape by holding down OPTION and START, or if you have a 400/800
by removing the BASIC cartridge and holding down START.
Error 140 and 143 are in the BASIC manual too I believe. They are
just load errors. (I/O error, bad tape etc., too much noise)
If someone saved the stuff with the LIST command, you might want
to try the ENTER "C:" command to see if that works, if you are
certain that the stuff is BASIC files.

If you have access to a PC with a sound card and some hard disk space
to spare, download the WAV2CAS program from the Umich archives.
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Then use a wave recorder program like wave studio to digitize your
cassette tape into a WAV file. Process the WAV file with the WAV2CAS
utility, and you will (hopefully) be able to see what it is that is
encoded on the tape, if you have some utility that allows you to view
the resulting .cas file in hexadecimal.
If you don't have a PC, go to a friend who does!

I am currently working on a program to turn the .cas files back into
cleaned up WAV files again, almost finished.
You should then be able to load them without a problem after

writing them to tape again.
Of course, if you have a SIO2PC or APE cable, you can load the
cassette images off of your PC.

Don't you just love tapes?
Keep those XL's/XE's humming
Ernest.

2653. Re: Atari Light Gun?

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-03 00:00:00 UTC
From: Ted O'Neill <toneill@best.com>
Message-ID: <36DDCA36.3549F2F9@best.com>
Source record: 54169

Answer to my own question, in case anybody else cares:

To modify the Sega gun for the Atari, you'll have to cut off the incompatible connector. The
wires must be stripped back and soldered into an Atari joystick connector as follows:

SEGA GUN ATARI JOYSTICK PORT
---------- ------------------
Blue wire Pin 1 stick FWD
Gray wire Pin 6 trigger
Green wire Pin 7 +5 volts
Black wire Pin 8 Ground

Because of the close-fitting connections for the XEGS ports, don't wire in a DB9 female
connector that has "ears." Most joysticks don't have wires for unused signals, so cutting up an
old joystick cable may not work. Specifically, an Atari joystick does not need the +5 volts, so
there isn't likely to be a wire connected to Pin 7. However, you can find joystick extension cables
at Radio Shack, which have all nine pins wired from male to female. ANTIC disclaims
responsibility for any damages that might occur during improper implementaton of this, or any,
hardware modification project we publish.

Once it's all hooked up, you'll notice that gun fires when you release the trigger, which is
annoying. The Sega trigger wiring is the opposite of what the Atari light gun uses. To rewire the
trigger switch, remove the five screws (one is under the Sega logo on the side). Find the trigger
micro switch with three connections. Wire to the normally closed contacts instead of normally
open.

(From Antic reprint at www.atarihq.com:
http://www.atarihq.com/atcomp/xegs.html)

Bret;
As I posted in another message to this board, this will not work. I tried it with a "C" ROM. Basic would not load from the 800XL. The ROMS are soldered in (both cart and MB). I desoldered, removed, installed, found it didn't work, desoldered, removed, reinstalled in the original locations, and all worked OK again, so I knew it wasn't because I blew a ROM chip. As I recall, it was reported in either ANTIC or Analog magazine that this mod WOULD work. That's the reason I tried it to begin with, but it failed to work.
Gary

I don't think so. They look like a standard cassette player. One is a
nice clean beige color and the other a little yellowish.

Having given up on my 410's I know where you are coming from. It seems
the main drive belt gets loose after sitting unused for
5 or 6 years :) I got the same checksum errors on old tapes but was
able to record new ones just fine.

Anyone know where I can get a copy of the old "LeBreak" animated ATASCII program?? I also used to have a disk util program called "ZEROFREE" written by Mike Stortz that I'd like to have again.

Thanks for any help locating these.

Well you could always open it up, a Dremel Tool with a saw bit works
well, and replace the fuse. That is what usually is the matter with
them.

A hacksaw also works as does dropping them till the case splits.

Have fun.

2669. A new Atari 400 problem (Joysticks)

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-04 00:00:00 UTC
From: Bret Kellihan <bkellihan@earthlink.net>
Message-ID: <7bl9uksvd1@murdoch.acc.Virginia.EDU>
Source record: 54177

Ok... I haven't quite got the 410 tapes working... the recorder is
functioning ok though. Now I have a joystick problem...
Below is background info that may help in understanding the problem, skip to
*** IMPORTANT PART *** if you don't want to read it.

I don't have any Atari Joysticks. So I went to the store and bought a Sega
Genesis controller. I knew it wouldn't work from previous experiences 10
years ago, but I thought I could solder connections inside and get it
working. I thought I had. Unfortunately the fire button cannot be pressed
at the same time as a direction controller

I thought this was my workmanship... I was testing the controller on several
games, and I was reading the port using STICK(0) and STRIG(0)... sure
enough, everytime I push the button and move the control stick...the button
becomes intermittant... (switches from 1 to 0 and back irradically). I
thought I'd take the control apart and see what was going on...

*** IMPORTANT PART ***
As it turns out i had the thought to try it in one of the other control
ports on my computer. As it turns out, reading the control from Controller
Jack 2, which is STICK(1) and STRIG(1) I have no problems... So I am now
assuming that I built my controller well and there is a problem with the
actual port.

Is there a known cause for this. Would it be possible to swap one of the
other four parts to fix the problem? Is there a simpler solution?

Thanks,
Bret

Hi,

> See if you can find a trace repair pen at an electronics store. Its a pen with
> silver conductive ink that you can use to redraw the traces
I didn't know they had that paint in pen-form, so when *it* happened I
bought a small bottle of that paint. Expensive! :-(The problem is that
I have to retrace all of the traces, because there is no way I can see
were the conductive material is removed. This would be a problem, but I
can try! Thanks for your ideas guys! You've been a great help.

Regards,

Wim

Well, I can tell you one thing, there is no copy protection on Temple of Apshai. At least, on the tape version that's what I found. When I started using an 800XL and a 1050 (rather than a 400 & 410) one of the first things I did was to copy temple of Apshai over to disk. The fact that its in basic made it that much easier.

2674. Re: 800 xl basic (again)

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-04 00:00:00 UTC
From: Richard Cortese <ricortes@netmagic.net>
Message-ID: <36DEAA12.2BD0C4C3@netmagic.net>
Source record: 54182

I wouldn't recommend trying it again, fragile motherboards and all that,
but it should work. For instance, I had one 800xl with the ed/asm cart
rom replacing the basic, then eventually replaced it with a basic rev C
chip I got from B&C. I can't remember which game I did this with,
Galaxian or Missile Command, but I set up another 800xl for my kids with
the the game build in so it would start on boot.

FWIW: I also put sockets in so I could jerk around like this w/o having
the motherboard see a lot of stress. Only socketed the memory chips for
an expansion and OS/BASIC, but that was enough to keep me busy.

2680. Atari Cartridge Storage?? Does it exist???

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-05 00:00:00 UTC
From: Bowling <mbowlin1@tampabay.rr.com>

Source record: 54046

Does anyone know of ANY commercial storage case -- or storage "system" --
that effectively, neatly, and conveniently stores large quantities (say,
over 12) of Atari 400/800 carts, so that you can actually browse through
your collection without having to "unstack" piles of carts to look at the
front labels? There seem to have been several manufactured for the "2600",
but hardly any for the 400/800 carts (I know about those "books" that held
eight Atari carts, but those things cost about $7 each, and don't hold
enough carts).

Well I'm real tickled that you know what a ZIF socket is, but do they
come in that form factor?

Good point! May I also add, that if a BASIC file was saved with the
command SAVE "C:" then it needs to be loaded with LOAD "C:"

Please direct all replies through E-Mail to bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I do not regularly read NewsGroups.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/ Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Way back in the day, you could get a Flip-n-file for 8-bit carts. I've got a
couple of them. Maybe someone'll put one up on eBay..

I resorted to using a 3 dollar label maker and putting those cheesy
little tape titles on the ends of my carts :)

-with XEP-80
-with any particular terminal program

Video Upgrades
-Adding chroma video signal to 600XL/800XL/1200XL

What is APE?

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400, "Candy."

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan, mailto:finneganj@delphi.com)
Jerry Jessop, mailto:jjessop@ix3.ix.netcom.com
Scott Emmons, mailto:scotte@center.uscs.com

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design

Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

OS PROGRAMMERS:
Larry Kaplan
David Crane
Bob Whitehead
Al Miller

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

The 800 can be fitted with 1-3 of the following two RAM modules:
CX852 8K RAM module, CX853 16K RAM module
and must be fitted with a ROM module:
CX801 10K ROM, CX801-P 10K ROM for PAL machines

[WHEN WAS THE 400/800 REVISION B OS INTRODUCED????]

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Buss Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the 1064 Atari Memory Module.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Atari Games Corporation is a developer, marketer, licensor and publisher of coin-operated video games, having created such classics as Pong, Asteroids, Centipede, Missile Command, Gauntlet, Area 51, and San Francisco Rush Extreme Racing. Atari Games Corporation is a subsidiary of Midway Games Inc. (NYSE:MWY). The Atari Games Corporations home page is at http://www.atarigames.com.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge

Interface (ECI), continuing the powerful feature of a fast parallel port. European 65XE's include the ECI port.

Only by the final production run of the 130XE (when was this???) was the XL/XE OS revised to include a "keyboard test mode" that matched the XE keyboard, and a RAM test that tests the full 128K of RAM.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

Hasbro Interactive, Inc. is a leading all-family interactive games publisher, formed in 1995 to bring to life on the computer the deep library of toy and board games of parent company, Hasbro, Inc. (Amex: HAS - news). Hasbro Interactive has expanded its charter to include original and licensed games for the PC, the PlayStation(R) and Nintendo(R) 64 game consoles and for multi-player gaming over the Internet. Headquartered in Beverly, Massachusetts, Hasbro Interactive has offices in the U.K., France, Germany, Japan and Canada. For additional information, visit Hasbro Interactive's web site at: http://www.hasbro-interactive.com .

Atari Interactive, Inc. is a Hasbro affiliate, online at http://www.atari.com/

Atari currently markets Centipede, see http://www.atari-centipede.com/

Subject: 1.2) What can I do with an 8-bit Atari?

What can you do with an 8-bit Atari computer system? Virtually anything you can do with any other type of computer!

Programming? Pascal, C, BASIC, Logo, Pilot, Forth, Lisp, 6502 assembler... Plus powerful unique languages like Action! and QUICK...

Word Processing? Try AtariWriter, Letter Perfect, Paperclip, TextPro, Bank Street Writer, 1st EXLent, TurboWord, Cut & Paste, Letter Wizard, Panther, Superscript...

Database? Try TurboBase, TurboFile, Synfile, Data Perfect, MicroFiler, MegaFiler, Homebase, Super Data Base 1-2-3, Small Business System...

Speadsheet? Look at Syncalc, Visicalc, TurboBase, Calc Magic, Turbo-Calc, SAM Budget...

Communications? There's Express!, BobTerm, Kermit-65, Omnicom, VT850, Chameleon, Ice-T, FlickerTerm 80, Term80...

Graphics? Print Shop, Newsroom, Blazing Paddles, Video Title Shop, Virtuoso, Movie Maker, News Station, Publishing Pro, Awardware, Page Designer, ChromaCAD, Rambrandt...

Music? Virtuoso, Music Studio, Music Construction Set, Songwriter, Electronic Drummer, Music Painter, Music Composer, AtariMusic, MIDI-Track, Digital Music System, Chaos Music Composer... The ATARI 8-bit could also be made to speak using SAM (Software Automated Mouth) by Don't Ask Software. It can speak without the use of any hardware modification.

Alternate Operating Systems? There's the Diamond Graphic Operating System; SpartaDOS X, the 64K DOS on a "supercartridge"; the S.A.M. (Screen Aided Management) 80 column Desktop System; the Ultra Speed Plus OS; the TurBoss! High Speed O/S...

Hardware? A plethora of upgrades and add-ons are available, realizing improvements in speed, memory, sound, graphics, storage media...you name it!

Education? Colorful graphics, exciting sounds and full-screen editing give rise to hundreds of quality educational software titles.

Entertainment? The 8-bit Atari has long been famous for thousands of great games.

If you want to do something with a computer, chances are you can do it on an 8-bit Atari computer. While slower than today's PC's, the 8-bit Atari is far less costly than any of these, is easier to program at the machine level or alter at the hardware level, and has been documented more thoroughly than any of the newer computing platforms. The relative simplicity in design of the 8-bit Atari also means that many people find the systems more reliable than their modern counterparts.

The software for the 8-bit Atari is sometimes more powerful than on any other platform. For example, some Bulliten Board Systems are still run on 8-bit Ataris specifically because the BBS software available can be better than that for any other type of computer. There is a reason for the relative quality of software on the 8-bit Atari. People program commercially for the latest PC's to make money; people program the 8-bit Atari because they want to -- they enjoy producing good software. It takes a team of specialized programmers to develop a major piece of software for those other systems; with the 8-bit Atari, a single person has the chance to learn the entire system, thereby developing greater pride in his programming abilities and his final product.

The character of the programmer can shine through.

The 8-bit Atari owner can take pride that his/her computer platform was developed years before the IBM PC or Apple Macintosh were even on the drawing boards, but remains as useful today as it was in 1979.

For these reasons and more, the 8-bit Atari remains a popular alternative in today's home computer marketplace.

Subject: 1.3) What are the some of the performance features of the 8-bit Atari?

Some of this text by mailto:nbs@sonic.net (Bill Kendrick).

CLOCK SPEED:
NTSC machines: 1.7897725 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

ANTIC AND THE DISPLAY LIST:

ANTIC Mode #	CIO/BASIC Graphics #	Type	Display Resolution (full screen)	Number of Colors
2	0	Char	40 x 24	1 *
3	-	Char	40 x 19	1 *
4	12 ++	Char	40 x 24	5
5	13 ++	Char	40 x 12	5
6	1	Char	20 x 24	5
7	2	Char	20 x 12	5
8	3	Map	40 x 24	4
9	4	Map	80 x 48	2
A	5	Map	80 x 48	4
B	6	Map	160 x 96	2
C	14 ++	Map	160 x 192	2
D	7	Map	160 x 96	4
E	15 ++	Map	160 x 192	4
F	8	Map	320 x 192	1 *
F	9 +	Map	80 x 192	1 **
F	10 +	Map	80 x 192	9
F	11 +	Map	80 x 192	16 ***

* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile

graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSLE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

Subject: 1.4) What is the internal layout of the 8-bit Atari?

The following four paragraphs were written by Chris Crawford and appear in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. The text been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of

power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

While the 400/800 models contain a generic 6502 CPU, all of the XL/XE models contain Atari's customized 6502C chip. Alan Manuel K. Gloria, mailto:mani@pworld.net.ph writes:

The difference goes something like this: On the Atari, there are two microprocessors, ANTIC and the 6502 or 6502c. To allow them to coexist, ANTIC must shut off the 6502/6502c, a process called DMA. The 6502 supports DMA, but in Atari's implementation, it required 4 chips. The 6502c has this additional circuitry built-in.

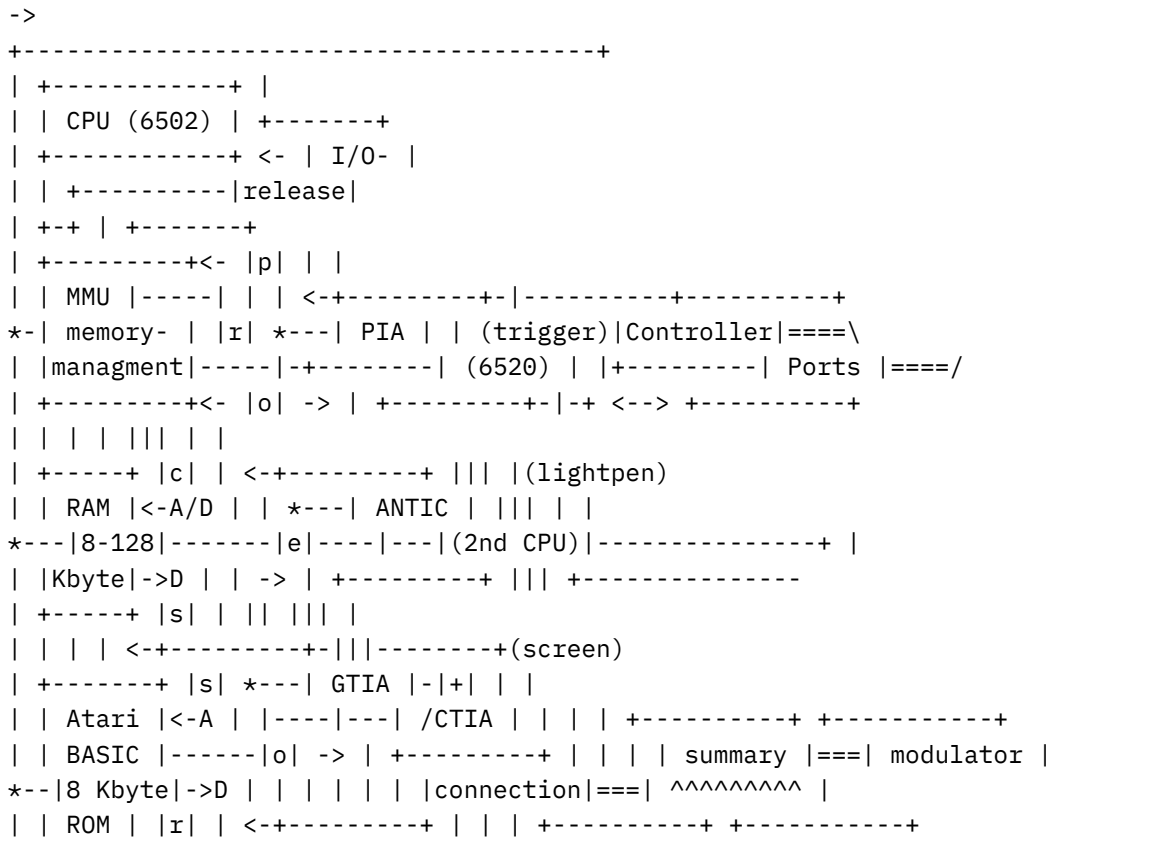
More on this from James Bradford, mailto:sup8pdct@mail.cth.com.au :
The 6502c in all PAL atari's, late 400/800, XL, XE NTSC atari's have A special 6502. This 6502 has an extra line called HALT. It is controlled by ANTIC which it uses whenever it needs the data/address bus. The HALT line is on pin 35 of the atari 6502 and must be pulled high for the chip to work (I think) . Early 400/800 NTSC atari's used a standard 6502 and a couple of chips to stop the processor when antic needed the busses

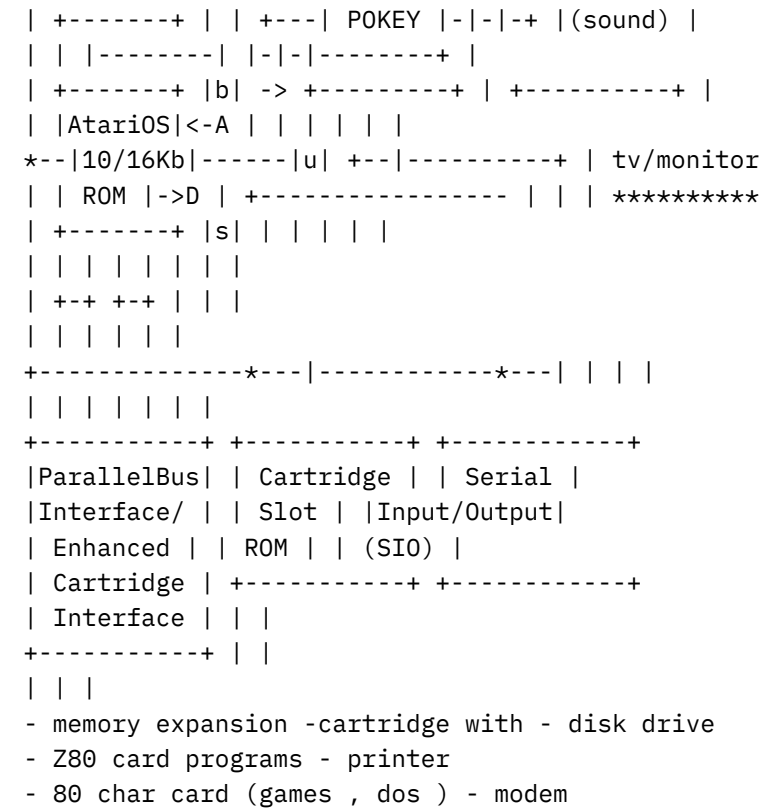
The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@mail.cth.com.au (James Bradford), "FREDDY is a type of memory controller. It takes the

address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

And more recently James Bradford has written:
Freddy is just a memory decoder and timer. It replaces several chips in the 800xl The small chip near freddy does all the bank selection. CO25953. One line from freddy , Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. a pin for each bank. If i remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800xl work just like a 130xe with this chip since Ras (Cas?) is required by ALL dynamic ram.

Hardware Arrangement (With thanks to mailto:peter@soemtron.handshake.de (Thomas Havemeister))





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE only

Subject: 1.5) How did Atari get it's name?

Graham Thornton, mailto:dangermouse@prodigy.nospam.net types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are thiers, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the Atari 8-bit family of computers, including the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE and the XE Game System!

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st.

Large binary posts do not belong in unmoderated discussion groups like comp.sys.atari.8bit. If you wish to share PD/freeware/shareware, use alt.binaries.atari and alt.binaries.atari.d or upload the software to the University of Michigan Atari Archive.

To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

Subject: 2.2) What other Usenet newsgroups cover the 8-bit Atari?

news:comp.sys.atari.advocacy
Attacking and defending Atari computers. Unmoderated.

news:comp.sys.atari.announce
Atari related hard/software announcements. (Moderated). Dead newsgroup?
Moderated by Yat Siu, mailto:ysiu@HUGE.Net

news:comp.sys.atari.programmer
Programming on the Atari computer. Unmoderated.

news:rec.games.video.classic
Orphan home video game systems. Unmoderated.

news:comp.emulators.misc
Emulating one kind of computer on another. Unmoderated.

news:comp.emulators.announce
Announcements related to computer emulators.
Moderated by Qualcomm, mailto:emulators-request@qualcomm.com

news:alt.binaries.atari
uuencoded software for Atari computers. Unmoderated.

news:alt.binaries.atari.d
Descriptions/discussions on software posted on alt.binaries.atari. Unmoderated.

news:alt.binaries.comp.atari8bit
uuencoded software just for the 8-bit Atari. Not widely available.

Subject: 3.3) What is ATARIPL?

From: Wojciech Hartman <harti@waw.pdi.net>
Date: Saturday, March 15, 1997 3:51 AM

I am proud to announce that there is a mailing list "ataripl" for all
polish-speaking Atari users and enthusiasts.

To subscribe the lists you have to send an email to
mailto:majordomo@piwo.bl.pg.gda.pl containing a line "subscribe ataripl".

Subject: 3.4) What is ATARI8-L?

maciej grzeszczuk, mailto:krap@zwieracz.ideefixe.nom.pl writes:

i'd like to invite all of you to atari8-l mailing list.

it's probably the biggest atari 8 bit related mailing list in the world -
- connected bidirectionally to old list at MARIST, and gatewayed to the
FidoNet(tm) international ATARI8-L echo.

for now it has about a 100 subscribers, from all around the world. the list
is free from all the F/S messages, and other off-topic discussions, so
you can find there pure atari8 related stuff... all the messages comes right
to your email account, so there is no need to contact a newsserver, there
is no old-messages deleting, and so on... my wish is that every atari user
would be subscribed, so the atari community stay together and grow in
strenght.

to subscribe, please send the message to majordomo@zwieracz.ideefixe.nom.pl
with the following line in the body (not the subject) of your message:

subscribe atari8-l

the language we use is, of course, english. the list is fast, reliable,
regularily maintained.

there is also mail2news gateway that translates all postings on the list to
easy to read usenet articles, available read-only to everyone at:
news://zwieracz.ideefixe.nom.pl/listserv.atari8-l

the atari8-l mailing list is available as well as a newsgroup listserv.atari8-l
on public newsserver zwieracz.ideefixe.nom.pl .

there is also archive of all postings that appeared on the list (well, in fact
almost all - about first hundred is missing).

(There's an old list called INFO-ATARI8 which is actually still alive. But
knowing about it is know longer necessary, as 100% of its postings are cross-
posted with atari8-l.)

Subject: 3.5) What is ATARI8PL-L?

any atari 8bit related threads are welcome. Polish language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.ideefixe.nom.pl

containing a line:

subscribe atari8pl-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.ideefixe.nom.pl

Subject: 4.0) What is XL Search?

XL Search is a new and growing search engine created and maintained by
mailto:nbs@sonic.net (Bill Kendrick), designed to provide much-
improved access to the various PD/freeware/shareware Atari 8-bit software
archives available on the Internet.

XL Search is located at: http://www.sonic.net/~nbs/xlsearch/

You can also access XL Search via e-mail! Send mail to:
mailto:nbs@sonic.net with the subject "xlsearch" for details.

mailto:nbs@sonic.net (Bill Kendrick) himself writes:

http://shareware.com/ , c|net's FTP-site search engine, now includes
the Atari 8-bit files at UMich!

Unfortunately, being under the previously-existing "Atari" category,
the files are now pretty mixed in with the ST stuff. I've talked to them
about fixing that. No reponse yet (they're really slow that way)...

Anyway, so now you can use http://shareware.com/ to find Atari stuff..
just be careful what directory you pull it out of! :)

Remember, you can ALSO use MY MINI VERSION OF SHAREWARE.COM!....

XL Search, the Atari 8-bit FTP site search engine!
If anything, it's much less cluttered than Shareware.com! ;)

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of
files for many computing platforms, including the Atari 8-bit computers. For
more information:

Bill Kendrick, mailto:nbs@sonic.net (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich Archive. The Archivists request you use these mechanisms in this order of preference:

1) The number one way to get into the UMich archives is via AFS. If you have AFS, all our files are kept in the directory "/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT! Specifically, use:

file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software Archives" choice. Specifically, use:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/ Specifically, use:

http://www.umich.edu/~archive/atari/8bit/

Mirror web sites:
http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
http://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory. Specifically, use:

ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are several mirror sites which are all updated from the home site regularly:
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/
ftp://barnone.citi.umich.edu/atari/8bit/
ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
ftp://pmftp.cs.vu.nl/pub/atari8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How can I retrieve files from FTP sites by e-mail?"

Uploading

General uploading tips:
- No uploads may be made to the Archive's mirror sites.
- Please also upload a short text file describing what your upload is. You might also suggest what permanent 8bit subdirectory you'd like your file to end up in.
- Note that the 8bit/New directory is "write-only."

1) upload via AFS:
Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

2) upload via FTP:
FTP to atari.archive.umich.edu, cd into "8bit/New", and upload your files.

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

3) upload via E-Mail:
Simply uuencode the file and mail it to mailto:nbs@sonic.net (Bill Kendrick).

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by mailto:eyvind@stud.unit.no (Eyvind Bernhardsen). PVV stands for ProgramVareVerstedet, or The Software Workshop, a student society at the University of Trondheim, Norway.

ftp://ftp.pvv.unit.no/pub/atari/8bit/ (129.241.210.232)

Uploads go to /incoming/atari/8bit; Eyvind will move them to the appropriate directory. Please include a readme file with each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

A mirror of Kevin Atkinson;s ClarkNet Archive, kept by Jason Duerstock: ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari 8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Polish Demo Archive?

It's a place when you can get all Polish (not only) demos (not only)
on a Atari 8-bit.
If You have any comments, write to:
mailto:LukSoft@hipokrates.am.lublin.pl

ftp://hipokrates.am.lublin.pl/sys/pub/atari8/

Subject: 4.7) What is the Atari 8bit FTP Archive in Slovakia?

This FTP site contains demos, games, utilities, zines and other useful stuff
from all the world. Also, you can download big amount of slovak and czech
programs for 8bit Atari only from this archive. And finally, because this
site is created and supported by slovak computer group GMG, most of our
products can be found right here.

If you want to place here your program, just send it to me (with some
comment) by e-mail and I will do the rest.

If you have some problems or questions, please contact me at this address:

mailto:mchorvat@econ.umb.sk (Marek Augustin Chorvat)

ftp://svs.scsss.sk/pub/atari

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

Internet access to the Cleveland Free-Net (Cleveland, Ohio, USA):

telnet://freenet-in-a.cwru.edu or
telnet://freenet-in-b.cwru.edu or
telnet://freenet-in-c.cwru.edu

Type "go atari" at any menu.

Contact:
mailto:xx004@cleveland.freenet.edu (Atari SIG)

The Cleveland Free-Net now has a home page:
http://cnswww.cns.cwru.edu/net/easy/fn/

Subject: 5.2) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or

mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.3) What is the Victoria Telecommunity Network Atari Users SIG?

Internet access to the Victoria Telecommunity Network (Victoria, British Columbia, Canada):

telnet://freenet.victoria.bc.ca (Type "go atari" at any menu)

Contact:
mailto:ua558@freenet.victoria.bc.ca (Gordon Hooper) or
mailto:ud264@freenet.victoria.bc.ca (Ted Skrecky)

Subject: 6.1) What is FidoNet?

[NOTE - Michael didn't write this section. If you know who did, I want to give that person proper credit!]

FidoNet is a system not unlike the Internet in that it consists of BBSs linked together. Each discussion group (there are nearly a thousand) may or may not be carried by an individual BBS as the sysop chooses. Discussion groups are called echoes, and each echo must be moderated. There is an Atari National Echo which is 8-bit, and several (I believe) ST echoes. BBSs are also free to have local discussion groups that may or may not be echoed nationally.

To access FidoNet, you need to find a FidoNet BBS that carries the echo or echoes you wish to read, and then abide by the rules of both that BBS and the echo. Some of these BBSs require annual membership fees. Some are supported by voluntary donations. One such that can also be reached by telnet is Doc's Place BBS. I'm not even sure of its location, but I think it's Clearwater, FL. If you're coming in via an ordinary ISP and either Netscape or IE, you simply type:

telnet://bbs.docsplace.org

mailto:krap@zwieracz.ideefixe.nom.pl (maciej grzeszczuk) adds:

all fidonet backbone echoes are carried by zwieracz.ideefixe.nom.pl, and they are available read-only via any newsreader. zwieracz itself (2:480/70, 2:48/70, 2:48/700, 2:2/3009) is the main polish fidonet-internet gateway. i gateway many usenet groups onto fidonet echoamil bidirectionally, so fidonet users here in poland can easily read and post articles. this group is also available at my system via EMSI over TCP or standard modem dial-up connection (emsi over tcp ports are 60177 - for telnet, and 60179 for raw socket).

try url: news://zwieracz.ideefixe.nom.pl/fido.atari and you'll reach national ATARI group.

Subject: 7.1) What is the Atari 8-bit Computer Web Ring?

A WebRing is a set of web pages that have been linked to each other. Basically the first page in the ring has a link to the second one, the second one to the third, the third to the fourth... with the last page linking back to the first. This is all done by adding a small piece of HTML code to your page, which will automatically keep track of where your page lies in the WebRing. In this way pages from all over the world dealing with similar subjects can be linked together. In our case the subject is Atari 8-bit computers, so all pages in this WebRing are about the Atari 8-bit.

The home page of the Atari 8-bit Computer Web Ring is at:

http://www.geocities.com/SiliconValley/Lakes/7953/a8ring.html

and the ring is maintained by Raphael Espino, mailto:rje@co.umist.ac.uk

---

Subject: 7.2) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

Paul Clark offers this tip:

I think Dalnet carries #atari8, do the following;

telnet://telnet.dal.net

At the login prompt, type;

dalnet

If prompted for a password, just hit enter. You should
be able to navigate to #atari8 from there.......

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by
typing irc at your shell prompt and jumping on an EFnet server
(irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed

anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:audioguy@cheerful.com for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text, but was a binary file. As a binary file, it had to be downloaded using a file transfer protocol such as XMODEM. The use of ".xmo" as a filename extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load file or disk image?

Russ Gilbert, mailto:russg@en.com writes:

The disk image part is a matter of taking a copyable boot disk and making an atr, xfd, dcm or other disk image type file out of it, usually for use with an emulator. Before emulators, the Bob Puff .dcm format was used to store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy protected. For boot disks, this usually involved a large number of special formatting that couldn't be copied using ordinary sector copiers. Usually the boot process involved checking to see if a certain sector error occurred, then proceeding. If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of memory and see if the value changed. If the value changed, the cart program was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the

software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE Pro system, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just

the 'standard' SIO2PC cable. The 'Pro' image can 'capture'
the copy protection of an original commercial disk. The
'Pro' image can then be loaded into an A8 using the APE
registered version software, thus backing up your original
disk software. Note the 'Pro' image will only be of use to
person(s) owning registered APE software and 'Pro' adapter
cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette
image file?

mailto:ernest@pi.net (Ernest R. Schreurs) writes:

For those of you that like ALL classic Atari software, there is now a
way to store all software that has been recorded on cassette tapes on
the hard disk of your PC. I have written a program that is similar to
the SIO2PC utility written by Nick Kennedy. But this one is intended
for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free
disk space to work with. The sound card should be able to sample sound
at a sample rate of 44.100 Hz mono. The sample must be recorded into
a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file.
The .cas file is a digital cassette image file that only contains the
data that is on the cassette tape. Once you have that, you can throw
away the .wav file. The .cas files are typically 16 to 64K, so they
are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette
image) you do not need a sound card. You do need a SIO2PC cable or
similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this
underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Keep those XL's/XE's humming.
If you have any questions feel free to E-mail me: mailto:ernest@pi.net

---

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel, mailto:itayc@hotmail.com
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.sitcom.co.il/users/itayc/

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation

Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing

]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:draco@mi.com.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of

course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 11.5), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (Russ Gilbert)

Q: How do I connect two cmputers using a null modem cable?

A: You need a term program and RS 232 ports on both computers. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25 pin port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin #3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go to the left 1 to 13 then #14 is under #1 and left again so that #25 is under #13.

Most term programs allow a null connection, without a carrier detect. Notably, 'Express 850' does not. I have only used 'Procomm 2.4.3' (the last shareware version of Procomm) on the PC and Bob Term on the Atari, but other term programs may work.

To check your null modem connection, start both PC and Atari term programs, set baud to 2400 or 4800 on both computers. No parity, 8 data bits, 1 stop bit on the PC. Be sure to use the correct COM port on the PC. Go to 'terminal' mode and you should now be able to type on either computer and see it on the other screen. To accomplish a file transfer, use Y-modem probably from Bob Term, rather than X-modem. X-modem will often append bytes to a file transfer, an undesirable event. There is also a very nice Z-modem recieve program for the Atari, called AtarZmodem by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors (Radio Shack) some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: connection, MIO, Black Box or similar device

that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C
port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you
need the flow control lines and Atari term software that
has flow control built in. You also need an MIO or Black
Box, which uses the PBI (parallel bus). A high speed
cable would need not only XMT, RCV, and GND, but also
flow control lines. I suggest a commercial null modem
from computer store to ensure correct lines. A null
modem is a small adapter with the correct lines already
crossed. I don't know how to correctly connect the CTS,
RTS, DTR, DSR, CRX lines for a high speed null modem.
With a null modem, you just plug it into the 25 pin
connectors of the two modem cables you might already
have connected to your Atari and PC or Mac. You may need
a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here:
(Figure out or look for pin numbers on the ports.) Note
that these are pin assignments, and NOT null modem
connections with the XMT, RCV crossed and GND straight
thru.

Atari 8-bit PC AT 25 PC AT 9 pin
---
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI

Note: * above indicates the difference between an AT 9 pin
and a Atari 8-bit 9 pin cable connector. eg. If you check
continuity from pin 3 of 25 pin end and it goes to pin
4 of nine pin end, you have an Atari serial cable. If pin
3 of 25 pin goes to pin 2 of 9 pin end, you have a PC

serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 11.5) What is SIO2PC?

From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari programs could be stored on the PC's hard (or floppy) drives. It turned out to be quite successful. About 95% of my work was in the software, but a hardware device to convert logic levels was also necessary. This device is now commonly referred to as an SIO2PC cable.

Features:

Emulates 1 to 4 Atari disk drives

Store your Atari files on PC hard or floppy drives

Boot from the PC, real drive not needed to start-up

No software or drivers required for the Atari;
no conflicts: use your favorite DOS

Twice as fast as an Atari 810 drive and more reliable

Co-exists with real drives in the Atari daisy chain

Compatible down to the hardware level: use sector copiers, etc.

Print-Thru captures Atari print-out and routes to PC's printer

Convert Atari files to PC files and vice versa

1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy

SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOS XL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive

has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- UltraSpeed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- UltraSpeed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 67000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2001 "California Access"
SS SD/ED/DD 19200 bps or 38400 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2002 "California Access"
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European
Sysop Fox-1 writes:
The HDI drive is, like all other I mentioned, connected to the atari 8-bit
SIO-bus. It's a PCB on where you can connect up to 4 PC-mechanics, no matter
it's 360, 720, or 1440Kb, nor 3.5" or 5.25". It's (partial?) developed by
Erhard Puetz (aka Floppy-Doc, aka Sysop Atreju), but is not available anymore
due the lack of the hard-to-get high-speed floppy-controller.

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: MYDOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB

- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatible with the SDX)
- UltraSpeed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF551.
288 RPM

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades (CSS)
- Floppy Board (CSS)
- Percom drive upgrades

==> Atari XF351 or XC35
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.
Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (mailto:audioguy@cheerful.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43

o Booting from any partition (on the standard XL OS)
o Write protection capability
o 8 jumpers to set the device number for the operating system
o Sweet 16 compatibility

==> Fine Tooned Engineering Multi I/O II
An IDE interface. Released?

==> MSC IDE-Harddisk-Controller
created by Steve Birmanns and Matthias Belitz in Germany
mailto:stefan_birmanns@ac.cybercity.de
mailto:matz@kawo2.rwth-aachen.de
http://www.kawo2.rwth-aachen.de/~matz/atari/
* real device for the parallel-port of the Atari XL-Series
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at
one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* access of ATAPI-CDROM with additional software

Subject: 12.4) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch
Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus
separate chroma (color) and luminance (brightness) signals which the best
composite video monitors can take advantage of. Popular examples of such
monitors include the family of monitors produced by Commodore.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only
be used with a TV.

-the XE Game System provides an RCA-style jack in place of the Monitor port;
so it provides Composite Video but lacks separate chroma\luma signals

-the 600XL, 800XL and 1200XL lack separate chroma signal (can be added via
hardware modification)

-the XEP80 Interface Module produces a monochrome Composite Video signal via
an RCA-style jack. This higher-resolution signal produces crisp, clear 80
column text on 80-column monochrome composite video monitors.

The pinout of the Monitor port is in the pinout section of this FAQ list.
The monitor connector on the back of the Atari can be utilized using a
4-pin DIN to RCA converter. You don't need to build a separate cable.

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

"The best monitor for an Atari 8 bit that is readily available today would be
a television with an S-video input---these tend to be large and high-quality,
so the s-video input is the deciding factor there. You'll have to build the
cable yourself, and if you have an XL you'll want to do the Super Video
upgrade that Ben Poehland published in Atari Classics a few years ago---this
puts the chroma signal back on the pin that it should be and cleans up the
video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are
cheap-to-reasonable when you can find them."

mailto:bryede@emi.net (Bryan Edewaard) writes:

"Yes, the best choices are monitors that support "Separated Video"
(sometimes called Commodore video on Commodore monitors), or S-Video.
These monitors have separate color and luminance video inputs, which
give a sharper picture without cross-color artifacts - such as the
colored fringes on text when viewed on a TV (although some games use
these artifacts to get additional colors). If you have an XL
computer, then it needs an upgrade to support these monitors due to
the omission of chroma from the monitor port. the 800 and XE
computers don't have this problem.

The 2nd best choice is a TV or monitor that has a "Composite Video"
(usually called just "Video" or "Aux") input. This is a signal that
has the color and luminance information combined into one signal. The
picture will be a little less sharp, but still much better than using
the "Channel 3" output.

>Where might I find one?

I've seen them a flea markets, garage sales, swap meets, ham fests,
and in newsgroups like this one. Plus, many new TV's support S-Video
and Composite video inputs.

>What are the advantages of using one of these rather than a TV?

Well, it's all a matter of how many stages the signal must go through.

1. The Atari generates video as a color signal and a brightness
(luminance) signal. These are passed to the monitor port as Chroma and
Luma signals (XL's have no Chroma output from the factory).

2. The signals are mixed together to make a standard video signal
which is also passed to the monitor port as Composite Video.

3. Then the mixed video signal (along with audio) goes through the
process of being "modulated" into a TV radio signal (channel 3 or 4).
This step involves removing high frequencies from the video (blurring
it) and sending it to the TV in a fragile broadcast form that's
suseptable to all kinds of interference. Then the TV must (1) extract
the video signal from the radio signal, (2) separate the Chroma and
Luma components as best it can, then (3) divide the Chroma in R, G,
and B. Any of these steps that you can eliminate will help your
picture.

>Are there any other composite video monitors that anyone would recommend
>(and where might I find one)?

Maybe the 8-bit FAQ mentions these monitors. The most common one is
probably the Commodore 1702 which has a very good picture and is quite
reliable.

If you plan to use an XL (which I do), upgrading the video circuitry
makes as big a difference as what monitor you choose. Ben Poehland has
some excellent articles in Atari Classics magazines for improving the
quality of the XL's video, as well as restoring the missing Chroma
output."

Lonnie McClure mailto:lmcclure@ibm.net has the last word on Commodore monitors:

Comodore models: 1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*,
1084**, 1084S**.

* The 1902A used a DIN connector for chroma/luma, which makes cabling a
bit more of a problem. The composite and audio connectors are standard
RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN
connector for chroma/luma connections, like the 1902A, while some used
standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902
shares the same slightly rounded front case design as the 1080 and 2002,
while the 1902A is has a rather square case design, and was manufactured

by Magnavox (as were some of the 1084 and 1084S versions).

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is produced on disk or in a 16K ROM cartridge from K-Products.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
BW-DOS 1.30 and all other versions are available via:
http://atari.boss.com.pl/files

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Home Computer (1979) 8/16K, membrane keyboard, 400/800 OS
800 Home Computer (1979) 8/16/48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
65XE Personal Computer (1985) same as 800XL minus PBI (Europe: includes ECI)
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
800XE Personal Computer(1987?)same as 130XE but 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missile Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions. 410a - Taiwan
version
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 40-Column Printer -

1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XLF late 800XL with a redesigned motherboard, plus the FREDDY chip
800XLD low-cost 1450XLD, no modem&speech, include disk drive
controller&FREDDY
1250XLD Earlier name for the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives (controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE/AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80 col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 13.3) What are the power-supply requirements for my Atari
components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European
data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output). The
power (in watts) and current (in amperes) specifications of the original
equipment as presented here should be regarded as minimum values.
Higher-than-specified power and current capacities are entirely usable,

and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)
VA=VoltAmps

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and

export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

o Carina BBS -- a shareware product of Shadow Software.

o BBS Express! Professional -- a product of K-Products. See Vendor List.

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:F.Offenga@student.kun.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

Part# Version
~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the
GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell, mailto:earl.halliwell@dyess.af.mil provides this tidbit:

A bit of trivia: CTIA 400/800s artifacted in blue/green, GTIA 400/800s
artifacted in green/blue, and all XL/XEs artifact in red/blue.

Subject: 13.7) Which versions of the Operating System (OS) are there?

This section written by Freddy Offenga, mailto:F.Offenga@student.kun.nl

The following Operating Systems exist for the Atari 8-bit:

Rev. System(s) Models Size Part Nr(s)
~~~~~~ ~~~~~~~~~~ ~~~~~~~~~ ~~~~~~ ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
A NTSC 400/800 10kB CO12499B, CO14599B, 12399B (*)
A PAL 400/800 10kB CO15199, CO15299, CO12399B
B NTSC 400/800 10kB (?)
B PAL 400/800 10kB (?) (*)
1 A NTSC/PAL 1200XL 16kB CO60616A, CO60617A
1 B NTSC/PAL 1200XL 16kB CO60616B, CO60617B (?) (*)
1 NTSC/PAL 600XL 16kB CO62024
2 NTSC/PAL XL/XE 16kB CO61598B
3 NTSC/PAL XE 16kB C300717
4 NTSC/PAL XEGS 16kB C101687

(?) more information or confirmation required

(*) these versions should exist, although I've not seen them.
If you have one (or more?) of these, please contact me.

NOTE:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).

Alan Manuel K. Gloria, mailto:mani@pworld.net.ph adds:
Revision B on the 400/800 does exist -- it is referenced to a lot in
Mapping the Atari by Ian Chadwick, and is used on most Translator disks

for the XL/XE

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

contributors to this section:
mailto:jlodoen@shell.portal.com (Jeff M Lodoen)
mailto:olavese@online.no (Vidar \"Hawk\" Olavesen)
mailto:pmulvey@erols.com (Pat Mulvey)
mailto:sposey@ioa.com (Steven E. Posey) (Party Quiz controllers description)

The following games support 4 player head-to-head play. Remember, only the 400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor, Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad controllers linked together with RJ-11 jacks (standard phone jacks) to a box with
2 joystick port connectors.

Party Quiz by Suncom

Subject: 13.9) Why should I disconnect the 810/1050 power supply before connecting or disconnecting SIO cables?

Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

Subject: 13.10) What is Omnimon?

--This section was written by Scott Charles, mailto:scharles@blast.net

Omnimon is a add in board for the Atari 400/800 series of computers and a replacement OS chip for the xl/xe series of computers. The original Omnimon board fit onto the OS board in the 800 series and had a switch attached to it to disable the board. The 400 series required you to bend the circuit board into a right angle for it to fit inside the 400's case. (It was designed to do this.). The Xl/Xe version replaces the OS Rom chip inside the computer with one that contains the Omnimon code, and a revised OS to make the XL more compatible (no translator disks needed).

Omnimon itself is a machine language monitor residing from $C000-$CFFF, with a few variations. It was designed in 1981 by David C. Young (who also wrote Cartcopy, a copier for the right slot of the 800) of CDY Consulting in Texas. The first software revision of Omnimon had a few basic commands and was only 4K long, only for the 400/800. The second revision required the addition of a bank select switch, and was 8K long. Since it was addressed by the 400/800 as 4K, when you needed to use the code in the other bank, all the text on the screen flips upside down, you flip the switch and hit any key. The Xl and Xe versions of Omnimon do their bank selecting through the normal XL port for this function, so it is seamless.

So what can you use Omnimon for? Its main claim to fame is its ability to interupt any running program by pressing and holding the SELECT-OPTION-RESET keys. Depending on the sequence you press determines what kind of warm boot the Atari does. SELECT+RESET does NO warm boot, preserving the stack and flag values of the 6502. OPTION+RESET allows a warm boot (as if you had just pressed RESET) and interupts the vector at $C (initialation vector).

I think you can see where we are going with this - Omnimon was developed as a machine language developer's tool, much in the same way that the Happy modification was developed for legitimate backups. I.E. far more people use both products for software piracy. If you have an Omnimon! in your machine and you try to boot up an Electronic Arts program, for example, you will get a message that says "REMOVE ROM AT $C000", and the program hangs. (Hence,the need for the disable switch on the 400/800 version. There is no way to disable the xl/xe version, just switch it to an alternative OS.) The 400/800 version, since the disable switch just deselects the mapping of Omnimon to $c000 area, can be switched on and off at will.

I myself did not know what Omnimon was used for until I was using a sector editor on a program called Pharaoh's Pyramid, from Master Control Software. On it is a sector that reads, "REMOVE OMNIMON YOU DIRTY PIRATE". This got me to thinking, what does that mean? After about 5 months of playing around with the Omnimon board, I figured out how to use it to pirate software. In fact, it can be used to make most boot disks into binary files, and remove copy protection from countless more.

At the risk of sounding melodramatic, I can safely say that Omnimon hastened the demise of the Atari 8 bit computer by 2-3 years, because of its power.

Subject: 13.11) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines, but software designed on PAL machines (Europe) won't necessarily work on NTSC machines.

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they refresh the screen 50 times a second doing 1/2 the lines each refresh so they effectively repaint the screen 25 times a second. NTSC is 525 lines/screen with a 60 times a second refresh - again only half the lines each refresh so a 30 times a second frame rate. This would change the amount of time available during vertical sync pulse, and the number of lines that need to be redrawn each time.

Graham Thornton, mailto:nero@chicagonet.net adds:

I use both a real PAL Atari 800 and a PAL-ANTIC 1200XL here in the US.

Replacing the ANTIC chip with a PAL version changes the screen refresh rate to 50Hz which allows most of the PAL-only European software to run. Your system will still report itself as a NTSC machine, unless you change the ROM (see the Nir Dary upgrade), but most software doesn't care.

The one problem you might run into is your monitor. Replacing the ANTIC will mean your North-American Atari is now generating an NTSC signal at 50Hz, instead of the usual 60Hz. Some people will tell you that modern TVs and monitors don't care but that isn't actually true. My brand-new Sony Trinitron 15" colour TV/monitor goes bezerk with the upgraded 1200XL, but my 15-year old 10" Texas Instruments color monitor (designed for the TI-99/4A) is fine.

You can also use real European equipment here in North America, provided that you have a PAL-compatible TV/monitor. The frequency of the power system is irrelevant, as I use my 800 with a 110V/60Hz 1050 power supply.

Subject: 13.12) Is the software for the Atari 8-bit computers "TV-standard dependent?"

{some PAL demos flicker, or won't run at all on NTSC machines}

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

This is because PAL machines have a vertical refresh frequency of 50hz (NTSC use 60hz) which translates into more vertical blanking time for demos and other computation-intensive graphics software. So PAL demos that won't work on NTSC machines are usually returning from a VBI (vertical blanking interrupt) too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

mailto:thor@math.tu-berlin.de (Thomas Richter) adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt
is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough
to notice the difference, so all system timings like the keyboard auto-repeat
function depend on the TV system. These parts of the OS have been corrected
with OSB and the XL versions of the OS. However, as most games install a
VBI, their timing does still depend on the frequency -> they will run
slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the Antic-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the Xl computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

Subject: 13.13) What programming languages are available for the Atari?

Revision : 1.0
Date.... : 4/20/1997

==
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include;
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- Assembler Interchange Format, Project description
Version 2.2, 2-2-1997, Freddy Offenga

If you like to help or if you've something to add already,
just contact me. There's still a lot work to be done....
Freddy Offenga, mailto:F.Offenga@student.kun.nl
==
There are quite a lot! To get some structure in this section it's
divided into the following catagories;
a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

[D] = available on disk
[C] = available on cartridge

a) ASSEMBLER
- 130XE+ Makro Assembler v2.2, 1992 (Torsten Karwoth) [D]
Two pass 6502 assembler/editor. Supports extra RAM.
Highly compatible with Atmas II.
- Alfasm, Version 1.0, 1990 (Jeff Williams) [D]
Supports 65816 instructions (for the Turbo-816 upgrade
from DataQue Software). This assember is also known as
the Turbo-Assembler/16.
- Atari Assembler/Editor, 1981 (Atari) [C]
Two pass 6502 assembler/editor.
- Atari Macro Assembler, 1981 (Atari) [D]
Two pass 6502 assembler/editor.
- Atmas II Makroassembler, 1985 (Peter Finzel, Hofacker) [D]
Macro assembler with integrated editor and monitor.
- Bibo Assembler, 1986 (Compy-shop) [D]
- Datasm/65 assembler, Version 2.0, 1981 (DataSoft) [D]
Two-pass 6502 assembler.
- EASMD, Version 1.0, 1981 (OSS) [D]
- LADS, written by Richard Mansfield of COMPUTE! (for Commodore computers)
and ported by Charles Brannon to the Atari, is a very good 2-pass
assembler supporting assembly from memory AND disk [D]
- MAC/65 Macro Assembler, 1982 (OSS) [D/C]
Two pass macro assembler/editor.
- MAE, 1996 [D]
Supports 6502 and 65816 mnemonics.
- Nasm65 assembler, 1992 (Nat!) [D]
Highly portable cross assembler (written in C). Initially
made for the Atari ST. Highly compatible with MAC/65.
- PC-65 Assembler, Version 1.0 beta, 1996 (Jan Feenstra) [D]
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.
- Synassembler, 1982 (Steve Hales, Synapse Soft) [D]
Two pass 6502 assembler.
- ST-65 Assembler, 1991 (A. Stauffenberg, F.Offenga) [D]
A cross assembler for the Atari ST (written in 68000 asm).
- 6502 Cross-Assembler "xa", 1997 (Andre Fachat) [D]
written in GNU C.

b) BASIC
- Advan BASIC Compiler (Advan Language Designs)
- Atari 800 Basic, Version 1.0, 1981 (Microsoft) [D]
- Atari BASIC, Rev.C, 1983 (Atari) [C]
- Atari Microsoft BASIC II (Atari) [C]
- BASIC A+, Version 3.05, 1981 (OSS) [D]
- BASIC XL (OSS) [C]
- BASIC XE, 1985 (OSS) [C]
- Turbo Basic XL (Frank Ostrowski, Happy Computer) [D]
Interpreter, Version 1.5, 1985
Compiler, Version 1.1, 1985

c) C
- ACE C (John Palevich & Ralph Walden) [D]
This is a newer version of 'Deep Blue C'.
- C/65, Tiny C (OSS)
- C65
- CC65, 1989 (John R. Dunning) [D]
This public domain package includes; compiler, linker,
assembler and object librarian.
- CC8
- Deep Blue C, Version 1.2, 1982 (John Palevich, APX) [D]
Drawn from Ron Cain's public domain C-compiler.
- DVC C, Version 1.01, 1985 (Ralph E. Walden) [D]
- LightSpeed C, Version 1.08, 1986
(Clearstar Softechnology) [D]

d) PASCAL
- Atari Pascal, Version 1.0, 1982 (APX-20102) [D]
- Draper Pascal, Version 1.5, 1983 (Norm Draper) [D]
- Kyan Pascal, 1986 (Kyan Software) [D]
Package includes; compiler, linker and assembler.

e) LISP
- INTER-LISP/65, Version 2.1, 1981 [D]
(Special Software Systems, DataSoft)

f) FORTH
- ValForth (Valpar International)
- Extended fig-Forth (APX-20029)
- fig-Forth, Version 1.1 [D]
- fun-Forth (APX-20146)
- Grafik-FORTH
- QS Forth (Quality Software)

g) PILOT
- Atari PILOT, 1980 (Atari) [C]

h) LOGO
- Atari LOGO, 1983 (LCSI, Atari) [C]

i) All the rest
- Action!, 1983 (OSS) [D/C]
- Quick, Version 2.0, 1990 (Raindorf Soft) [D]

Subject: 13.14) What is the Atari XEP80 Interface Module?

This section written by: mailto:raukamp@dame.de (Thomas Raukamp)

Since the development of the Atari 8-bit line of computers in 1979, users
wanted better text displays than the default 40x24. There has been some
attempts to satisfy this need, like the Austin-Franklin board or the Ace
80/80xl cartridge. For more informations about these modifications read The
Atari 8-bit Hardware Upgrade FAQ from mailto:david_p@storm.ca (David A.

Paterson)

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 13.15) What makes some XL/XE software incompatible with the 400/800?

Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:

XL/XE software won't work on 800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 13.16) What games run only on the 400 and 800 models?

The following are reported as incompatable with models other than the original Atari 400/800. Most probably do work on XL/XE's if you use a translator to run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund
Aquatron Sierra On-Line
Atlantis Imagic
Attack at EP-CYG-4 (by Bram) Romox

Subject: 13.17) What games make use of the Light Gun?

mailto:jmouchmino@aol.com (Bertrand M. (LEXX)) writes:

Bug Hunt, Barnyard Blaster, Crossbow, Crimebuster, Operation Blood, Operation Blood II - Special Forces (not completely sure about that one), Light Gun

Blaster (PD), Gangsterville (Italian game written in BASIC), maybe a couple more...

Bertrand M. (LEXX)

Subject: 13.18) How do I type a tilde (common character in Web URL's) on my Atari?

The Shadow, mailto:The_Shadow@spnt.com writes:

The question is: "How do I type the tilde or squigly line which is in most web addresses? I don't have a key for it..."

Answer: The tilde is an inverse backspace on the Atari 8-Bit which can be very hard to type depending on the term program you are using, however you can insert the hex equivalent very easily, which is %7e in place of the tilde and it will work just perfectly. Do not put a space either before or after the %7e.

I (Michael) add:

Some advanced Atari software supports the tilde character natively. E.g., you can type a tilde in Ice-T with the Atari Logo/Inverse Video key.

Subject: 13.19) What's the difference between ASCII and ATASCII?

David Moeser -- erasmus att iglou dott com -- produced this nice translation table.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." Available via:

http://www.faqs.org/faqs/atari-8-bit/vendev/

and Usenet FAQ archives everywhere.

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

----

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

Trevor Holyoak, mailto:trevor@holyoak.com maintains the "Atari BBS List."

http://www.holyoak.com/atari/

A major revision has been done recently by mailto:clu-da-bard@geocities.com
(Doctor Clu).

Subject: 14.4) I'm new to the Atari. How do I use this thing?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by
mailto:nbs@sonic.net (Bill Kendrick). Bill and his FAQ are
excellent sources for information on basic usage of the 8-bit Atari, and for
information on the 8-bit Atari emulators which run on other computing
platforms.

See: http://www.sonic.net/~nbs/atari/info/emulatorfaq.html

If you'd like a text-only copy, simply send e-mail to
mailto:nbs@sonic.net with the subject:

send emulator faq

Subject: 14.5) Can I use an emulator to run my old Atari software on my new
computer?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by
mailto:nbs@sonic.net (Bill Kendrick). Bill and his FAQ are
excellent sources for information on basic usage of the 8-bit Atari, and for
information on the 8-bit Atari emulators which run on other computing
platforms.

See: http://www.sonic.net/~nbs/atari/info/emulatorfaq.html

If you'd like a text-only copy, simply send e-mail to
mailto:nbs@sonic.net with the subject:

send emulator faq

Subject: 14.6) What hardware upgrades, modifications and add-ons are available?

The Atari 8-bit Hardware Upgrade, Modification and Add-On FAQ is maintained by
David A. Paterson, mailto:david_p@storm.ca or see:

http://www.geocities.com/SunsetStrip/Alley/1878/hard_faq.htm

Subject: 14.7) What is the HARD-Interlacing-Picture (HIP) format?

HIP is a new method to displaing pictures on small atari...

HIP stands for HARD-Interlacing-Picture and was found by
Members of HARD Software, Hungary in June, July 1996...

It enables to display 160 x 240 Pixels with 30 shades without
nearly all flickering (depends on the source-picture you use)...
HARD stands not for HARD or HEAVY Interlacing, just for the
inventors...

For more information, see the HIP-FAQ, located at:
http://www.uni-karlsruhe.de/~Marek.Tomczyk/Atari8/hipfaq.html

or contact HeAvEn at mailto:nadkar@fh-pforzheim.de

Subject: 14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

The Accessing the Internet by E-Mail FAQ is maintained by "Doctor Bob" Rankin,
mailto:BobRankin@MHV.net or see:

http://www.faqs.org/faqs/internet-services/access-via-email/

From: Peter Pachla <my.name@vectrex.freeserve.co.uk>
Message-ID: <7bp5htvot1@news8.svr.pol.co.uk>
Source record: 54055

Hi Bret,

>Thanks for the info. That's more like what I was hoping for. :)

Glad to be of help, I did a fair amount of hacking about with the hardware of one of my 800XLs around '85/''86 but my recollection of some things is a little hazy now.

>....tie in a resistor to a switch and mount it on the case. Then tie
>the resistor to the onboard power supply and use that to pull bit 1
>of port B high to enable the onboard basic?

No reason I can see that you shouldn't be able to do that....except that you need to pull that line LOW to enable the onboard BASIC (it's already pulled high via a resistor).

>You have schematics of the 800XL?? Where could I find a copy of those?

Yes, I got them from a friendly Atari service engineer around 1985....I'm planning on scanning them in the next couple of weeks and putting them on my web page (I'm finally getting around to putting my website together). I'll get back to you on that shortly.

TTFN - Pete.

Terminally cheap. They cost 8 bucks!!!

I did this way back when I was burning carts, that is ZIF sockets on a cartridge board, because my source of the boards was about $7 a shot at the time. This was one of those things that worked out so badly, I didn't volunteer info on it. Impossible to fit the finished carts with EPROM's into a normal cart case, cutouts on a regular case were both ugly & interfered with the operation of the release levers.

But then, that is the story of about 90% of my hacks, so ugly or work so poorly I don't like to think about them<grin>.

2692. looking for SCRAM

Newsgroup: comp.sys.atari.8bit

Actually, if you find out exactly which keys are not
working you can limit your search to just the traces
needed for all of those keys. That should narrow down
your search quite a bit.

From: "A.'SoTe' B." <adam@nautilus.com.pl>
Message-ID: <36E03E88.9EF18810@nautilus.com.pl>
Source record: 54060

I'm looking for Pokey music (player+data) ready to run
on simple "atari emulator" (6502+pokey). Currently i'm
developing pokey emulator (much better than used in Atari800
emulator). This emulator will emulate pokey cycle-by-cycle.
I want collect some music writen for pokey.

From: vinnie5757@aol.comnospam
Message-ID: <19990305155027.23502.00003676@ng-fu1.aol.com>
Source record: 54062

Ok.. I know this is an Atari board..but....

wondering if any of you folks also happen to be fans of Guy Williams... he played 'Zorro' and Prof. John Robinson in 'Lost in Space'... (both are from the early 60's and are now back on cable...)
There is a petition to get his 'Star' added to the Hollywood Walk... if any of you are fans, and would like to add your name to the petition, please email me just your Name, City, State... I'll add your name to the petition...a total of 10,000 names are needed.... we're almost half way there!

When you do email, please delete 'nospam' from my address!
thanks

Vinnie

CHAT ONLINE *LIVE* WITH ALAN CAMPBELL: YEAR 2000 CONSULTANT

Saturday, March 6th 8:00 pm (Central Standard Time... USA)

We invite Alan Campbell to join us to discuss the Year 2000 and how it will really impact us.

His knowledge of this topic sterms from long term preparation efforts and has been working with top level individuals at U.S. forms about what they can do about it. It will be a very good, informative night.

Find out what is going to happen. Find out what you, the computing user, cannot do without. Find out what the real risks are.

You can ask questions and get answers direct from Alan Saturday Night at 8:00 PM Central Time.

Do you know what your bank will do? Your investments? Your 401K? Your sewage line?

Do you know which dates OTHER than Dec 31, 1999 are endangered? Are you sure?

We won't miss it! Please be there with us online.

HOW DO YOU GET THERE?

Browse to www.AtariUsers.com and enter the main chat room.

You are then able to choose frames or no-frames. This site has been made as CAB friendly as possible. Atari CAB users should use the no-frames link that appears.

This site has also been tested with the common PC browsers and Macintosh Netscape 3.0. While this is a service to the Atari community, others are welcome.

Log in and say hi to whoever is online at the time. Remember that the only scheduled chats are currently Sat. 8:00 pm CST.

This is a big event with a Y2K consulatant is is used to speaking to large gatherings of people. Make it a point to show Alan Campbell a harty Atari welcome!

2699. Flight Simulator II, .rom images, and Turbo Basic XL

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-05 00:00:00 UTC
From: locust000@aol.com
Message-ID: <19990305171006.05799.00003937@ng02.aol.com>
Source record: 54065

Hi Everyone! Can anyone tell me where I can get ANY or ALL .atr disk images of the scenery disks for Flight Simulator II? Also, can anyone tell me where I can get Atarixe.rom and Atariosa.rom for the Atari800Win emulator? I can find Atariosb.rom, Ataribas.rom, Atarixl.rom, and Atari5200.rom but not the others. And although I may not need them, I would still like to have them, because I DO have the real things (Atari 400 computer, Atari 800XL computer, Atari 130XE computer and a 5200). And there's one more thing to trouble you with; I also need an .atr disk image with Turbo Basic XL, Runtime.com, and Compiler.com ALL on it. I plan to use Turbo Basic with my personal programs on my virtual disk drives (using Atari800Win). ANY help would be most appreciated! Thank You!

Regards,
Locust

What kind of computer power is it going to take to do the cycle by
cycle emulation of pokey on top of the rest of the emulated Atari? We
aren't talking PIII-500MHz are we?

2708. FS (MN/WI): Complete Atari 8-bit/APE setup including "APE slave" PC

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-06 00:00:00 UTC
From: Sydtech <REMOVENOSPAM_sydtech@sydtech.com>
Message-ID: <7bqjmbrch1@jair.pressenter.com>
Source record: 54074
Cross-posted to: mn.forsale,comp.sys.atari.8bit

My complete Atari 8-bit APE setup is for sale at
http://www.sydtech.com/atari8

I've decided to get rid of the last of my Atari 8-bit hardware. I thought about auctioning this off on EBay, but I'd much rather get a local buyer for this - Minneapolis/St. Paul/Western Wisconsin - that can come pick it up. So, here's the setup:

- Standard Atari 1200XL, 64K, BUT with Steve Tucker's outstanding WARP+ OS mode (see http://www.nacs.net/~classics/) installed; two standard 1050 drives, Atari monitor cable, all power supplies and SIO cables, and a couple of AsciiPad joypads.

- An SIO2PC cable, of course!

- IBM PS/2 Model P75 486 "luggable" - with the red flip-out plasma screen. Has 12 megs of RAM and a 240 meg hard drive, as well as an Ethernet card. Has my registered copy of APE with ProSystem installed, as well as mirrors of a couple of Atari 8-bit sites. Has a flaky CMOS battery that requires re-entering some CMOS params, but this only happens occasionally if the machine's turned off. I left it up full-time as an "APE Slave" and it wasn't a problem.

- Commodore 1702 color RGB monitor. The case is beat up but it's functional.

This system provided a great deal of fun. I got a kick out of the fact that I could leave all my Atari stuff on an NT server across the room and have my 1200XL boot off the network drive via APE. But...I need to reclaim some space, the few Atari 8-bit games I still play work well under emulation, so out it goes.

For more details and pictures, please see http://www.sydtech.com/atari8.

Thanks,
Scott

As I mentioned in my first post... nothing... I'm an Atarian... have been since
'82... just took a shot at seeing if any others, as myself, might have been
into 'Lost in Space'.... there might be a bunch of us around the same age,
that might have watched that as kids! That's all...

Boxed Atari 1027 letter quality printer, power supply, SIO cable, oil, extra print rolls (I don't know their condition) and owner's guide.

Also with a boxed AtariWriter cartridge with owner's manual and quick reference card.

Additionally, APX Classics disks from Antic with Spell Magic, a spell checker compatible with AtariWriter.

Several months ago I offered a special deal for those of you that wanted the program. I received no ORDERS!, Yes this has been at least 6 or more months ago. I sold or turned over the program to Lance Rinquist of Video 61, several of you (Not YOU INDIVIDUALY) have contacted him and expected him to produce the product at the reduced rate. I at that time stated this was a limited offer and those of you that wanted it should have responsed to me not Lance!..One person said they had several module on order, this in fact is incorrect as I have received no request fot the program since the posting and all items are expired.. : Lance now owns the program and owes nothing to anyone!

Bob Klaas..

Mark,

Your post gave me the incentive to delve into the dark recesses of my old 8-bit Atari storage cabinet, and I found one of those nice flip-and-file storage cases designed to hold 18 cartridges or cassettes. If you want it, its yours for $5 plus shipping. Let me know in Email along with your shipping address so I can figure what the shipping cost would be.

Another possibility is to use audio cassette
cases. These typically hold a dozen or so
and have a lid. Not a perfect fit, but usually
a dollar or so each, stackable, etc. I've used
these for years. You might have to look a
little for these now, since the wooden racks
seem to be "in" at the moment.

Video Jogger by Exus for Atari 2600!!!! Condition: Excellent. Rarity: 9.
Purchase Price: 75 cents.
Now...I can die a happy man! (Out of all the "Ultra-Rares" out there, THIS is the only one that I had on my Most Wanted list...and I found it in THE WILD, for practically NOTHING!!! Go figure, huh???

I'm pretty sure they hold 12, using the individual inserts. There's enough
room to get another 4 or so in there, though.

I used to really like that game. I know I've got it on tape, I'll have to see if I copied it to disk. If noone beats me to it, I'll try to get it onto my PC and e-mail it. I'm sure I have the docs, too, if you need a copy.

Take this man straight to the doctor as he is delirious!

You can't leave Alan, its not possible..Its in your blood now,
resistance is futile :)

Seriously, glad you enjoyed the time, perhaps a break will make the
heart grow fonder.

Look after yourself...

Rich, any news (if at all) on a new version. Yep I know you are a busy guy so I don't expect you have that much free time.

If there is a version coming can we expect anything big :))

Hoping that the Pro images can be added at some point.

Many thanks

Message-ID: <36E3363D.2FD1DE2D@hotmail.com>
Source record: 54097

Dear Atari fan,
Crystalware, Inc. (creators of such classics as Fantasyland 2041, Sands of Mars, Beneath the Pyramids, Galactic Quest, House of Usher and many others), is re-entering the gaming scene.

John Bell/aka/JBMichaels, still President and Chief Game Designer of Crystalware, invites
you to visit our fledgeling site, offer your support and comments, and join our mailing list so we can send you a demo version of our first new

release.

Crystalware promises the same spell-binding atmosphere we gave you in our early games, but now with top-quality Hi-Res graphics, 3-D worlds and
fully interactive environments.
What is it, anyway, that makes the old games so much cooler than todays?

Could it be that they had SUBSTANCE???

Visit us today at http://members.tripod.com/~Crystalware
(or email us & we'll put you on our mailing list for updates!)
and thanks for remembering us!!!

ALSO COMING SOON (to the website):
Free downloads of all the 'classics' we produced
Free ATARI800 emulator downloads
Classic Walk-Through Guides

AND PLEASE!!! If you have any copies of our old games, let us know!!
We are trying to recover the full collection for our archives.

THANKS AGAIN!!!
John Bell (and Seby)
Crystalware, Inc.

2732. Re: "2600" Cart Defect?

> value? Or subtracts?

You're going to get exactly opposite answers on this, probably in approximately equal amounts.

It's clear that this is, as you say, a defect, so from one kind of collecting standpoint, it's worth less than one without defects.

On the other hand, there's probably not many of these mistakes out there, so from another kind of collecting standpoint, it's worth more than one without the defects.

I guess the main question is do you intend to get rid of it. If not, the value is precisely how much joy you get from playing the game. If you are looking to get rid of it, there are folks out there who pay more for mistakes, but you might have to hold out for a while to find them. I'd even suggest trying to trade for several carts you don't already have. Collectors of mistakes and variations tend to be pretty high-level collectors, and might very well have several extra copies of things you don't yet have, that they might be willing to trade for an oddity.

Jeff

>Coffee in 130XE
Last year, a toy-company in the Netherlands sold a whole bunch of Atari
65XE computers as a game-machine, with 10 games on cartridge.

There are people who want to get rid of the system, and they are
advertized in several papers, like "De Vondst" or "De particulier".

This Atari is actually exactly the same machine as your 130XE, and you can
just switch keyboards. When new, they're sold for about F.40,-, and I
guess you may find one for less, with 10 game-cartridges included :-)

Sysop Fox-1 (fox-1 AT aq DOT nl)

Gateway: THUNDERDOME, Atari 8-bit BBS. Running on ATARI 130XE. (Pro-node 471)

Hi all,
I've got the following items to offer.
(2) Atari 800xl computers (one has a slightly damaged keyboard), 1050 disk drive, 1010 recorder, 410 recorder, and okidata10 dotmatrix printer. I also have several copies of COMPUTE! and Antic magazines, and some games (mostly Infocom, such as Deadline, Suspended, and the Zork series). I'm looking for $200 for everything. Let me know.

2735. "2600" Cart Defect?

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-08 00:00:00 UTC
From: Bowling <mbowlin1@tampabay.rr.com>
Message-ID: <xSFE2.2889$Ku1.1856775@newse3.tampabay.rr.com>
Source record: 54101

I obtained an Omega Race cart, which was labelled on the WRONG SIDE of the cart. This was a FACTORY manufacturing defect; it is obvious from the pristine opposite side that the correct "label" side has NEVER had anything glued to it. Now...two questions:
1) Does anyone own the Booster-Grip adapter that was used to play this game? (and can you describe it to me?).
2) Is it your opinion that the manufacturing defect ADDS anything to its value? Or subtracts?

Alan, this seems a bit odd, at least to my style of thinking. Of
course I'm sure you have your own style of thinking but... wouldn't it
seem that the time to leave is when you are more interested in filling
your time with other things (computer related or not)? If you really
feel the way you do maybe now is the time to move on. Or, if you
still are interested in Atari8 enough yet, how do you know that in Dec
99 you then will not still be? December 1999 just seems so arbitrary
I guess.

2739. FS/T: Atari 8-bit computer items [03/08/1999]

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-08 00:00:00 UTC
From: VideoGameAdvantage@DittosRush.com
Message-ID: <36f195aa.38644044@news.nls.net>
Source record: 54105

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 03/08/1999

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection list for this system is currently on-line!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

{1} = requires 32K.
{2} = requires 48K.
{3} = requires 48K and printer.

Used diskette(s), with box and manual:
$ 2.50 Home Filing Manager, The (Atari)
$ 2.50 Print Shop, The (Br0derbund) {3}

$ 2.50 SynFile+ (synapse) {2} -- also includes Reference Card
$ 2.50 Timewise (Atari) {1}
$ 2.50 Touchdown Football (Electronic Arts) {2}
$ 2.50 VisiCalc (VisiCorp) {1} -- also includes Pocket Reference
Guide -- $5 shipping, due to weight, counts as 1st item

Loose cartridges, no box or manual:
$ 3.00 3-D Tic-Tac-Toe
$ 3.00 Alphabet Zoo [Spinnaker] -- no label
$ 3.00 Atariwriter
$ 4.00 Ballblazer -- XE cartridge
$ 3.00 BASIC -- for use with Atari 400 and Atari 800
$ 2.50 Centipede
$ 5.00 David's Midnight Magic [Br0derbund]
$ 3.00 Delta Drawing [Spinnaker]
$ 3.00 Dig Dug
$ 3.00 E.T. Phone Home!
$ 3.00 Frogger [Parker Brothers]
$ 5.00 Gateway to Apshai [Epyx]
$ 1.25 Missile Command
$ 2.50 Pac-Man
$ 3.00 Qix
$ 1.25 Space Invaders
$ 2.50 Star Raiders
$ 2.50 Super Breakout

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 3.00 Atari 1050 Disk Drive Owner's Guide (8 pages).
$ 9.00 Atari 65XE Personal Computer Owner's Manual (126 pages).
$ 5.00 Atari 800XL Home Computer Owner's Guide (22 pages).
$ 5.00 Atari BASIC Reference Guide: For Experienced Programmers
(14 pages).
$ 7.00 Atari Disk Operating System Reference Manual: DOS 3
(100 pages).
$ 5.00 Atari Home Computers: The Next Generation catalog
(32 pages).

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive does not include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 4.00

*****

LOT #2

ATARI 1025 PRINTER, with built-in power cord, and manual.

This item has not been tested.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 9.00

*****

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

It goes deeper than that, guys. Right now, I can be away from my Atari for a couple of weeks, and then it's intense to the point of not accomplishing other things I need to do. When you're a user group newsletter editor, that's the way it goes. But whatever time I spend now, I will need elsewhere in December and from then on. I'll also need the considerable room that my Atari hobby has taken up over the years.

Jon, as I've explained elsewhere, I'm a user group (Ol' Hackers) newsletter editor. If somebody is going to take over, they need training in the software and routines. If nobody is going to take over, that's one international 8-bit club that may need to reorganize or restructure the way that it gets info and programs to members.

I'm also the secretary of another user group (LIAUG.) Some of its members are considering a reorganization as a Linux group, and I'd like to be part of that. It's a small group at the moment, so every vote counts.

There are also issues coming up in December and beyond that will occupy a lot more of my time and make it necessary for me to free up the space currently occupied by nearly 13 years of 8-bitting.

I've thought long and hard about this. The advance warning is just as important as the reasons that I need to drop out.

As I have stated in previous posts, I do this from time to time. You
do need an interface for the Atari. I use an 850. I see these from time to
time for sale on this board. The 850 uses a non-standard RS232 9 pin plug,
and you must make your own cable to do the transfer. I do use an old IBM
DOS program to do the transfers. Its a simple matter to boot Win 9X to DOS
to use such a program. The ATARI end uses programs I have outlined below.
Not all of the modem programs available for PC's or ATARI support terminal
emulation, so either stick with the ones I used or be prepared to do some
research.

Gary

It wants the 850 interface handler. This loads right after DOS loads. It
can be found on the DOS 2.0 disks. I don't think it came with DOS 2.5 At
any rate, I do this quite a bit - only with a PC to atari 850 interface. If
you turn up the volume on the TV, you can tell when the handler loads - it
is a different pitched sound. The cable pinout is below, but it might be
skewed because of the line length. If you need it, email me.

Directions for making a null modem cable.

IBM ATARI 850 INTERFACE
25 pin 9 pin 9 pin

8 ------ 1 RLSD ----q---------------------------------- 1 DTR
6 ------ 6 DSR ----^ JUMPER TO (IBM RLSD)
3 ------ 2 RX ------------------------------------- 3 TX
2 ------ 3 TX ------------------------------------- 4 RX

```
20 ------ 4 DTR ----------------------------q-------- 2 RLSD
JUMPER TO (ATARI DSR) ^-------- 6 DSR
7 ------ 5 GND ------------------------------------ 5 GND
4 ------ 7 RTS ------------------------------------ 8 CTS
5 ------ 8 CTS ------------------------------------ 7 RTS
```

QMODEM ON THE IBM WORKS OK - AMODEM ON THE ATARI WORKS OK, HOWEVER, LIMIT FILE TRANSFERS FROM THE IBM TO THE ATARI TO 2400 BAUD. THE 850 OR AMODEM CANNOT KEEP UP WITH FASTER BAUD RATES. FROM THE ATARI TO THE IBM THERE IS NO PROBLEMS UP TO 9600 BAUD (LIMIT OF THE 850)

PCTOOLS, V 6, THERE ARE NO PROBLEMS FROM THE ATARI TO THE IBM AT UP TO 9600 BAUD. LIMIT SPEED FROM THE IBM TO THE ATARI TO 1200 BAUD WITH THIS SOFTWARE.

GARY

2744. Re: Atari 130XE to PC

Newsgroup: comp.sys.atari.8bit

Source record: 54110

One small addition:

DOS 2.5 came with a program called SETUP.COM. If you run it, one of the
options available is that it will create a small AUTORUN.SYS that loads the
handler from the 850.

2745. HACKING/PHREAKING Software for ATARI?

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-08 00:00:00 UTC
From: mark <webmaster@turborater.com>
Message-ID: <7c0hl0$4n4$1@nnrp02.primenet.com>
Source record: 54111

i am looking for some of the mid to late 80's programs that were written for the purpose of Hacking and Phreaking..

some of these programs would involve: wardialers (scanning sequentially for modem tones), tone generators (blue box, silver box, etc), code hackers (for finding long distance codes), etc..

i am definately not looking for these programs to *use* i just want them for nostalgia purposes.. i let someone borrow my original, from-the-eighties collection and i never got them back..

Good stuff but the web site is pretty broken. The front page doesn't load properly - graphics are missing and the links are all broken...

These would be cool to check out; most of the tone generators and such
probably would not work today unless you're on a really antiquated exchange,
so they really would be pure nostalgia. I was never into the phreak scene
back in the day, but I'd love to see some examples of Atari tools for that
kind of thing too.

brent..

there were MANY.. i used to have a huge collection..

you are right about the tone generators.. but the cool thing was the fact
that they LOOKED so cool.. i loved going back to the old atari 130xe with
the 1050 drive and pull up some of the old scanners, and tone gens..

are you into the phreak scene now?

Source record: 54122

Greetings all:

I'm a big fan of Philip Price's and Gary Gilbertson's game Alternate
Reality. I did not play it until the C64 version was released however.
I found via the world wide web some old messages from Philip Price
regarding him getting back into the gaming industry, etc... and am
wondering if anyone has updated news on what he is doing now?
I know of the current port to IBM, but frankly it's not all that great.

I've also read the FAQ at
http://www.ksk.sala.se/~rob/alternate-reality/alt-reality_FAQ.txt
but it doesn't mention any current work.

Another thing i stumbled across in my quest was this page:
http://www.aro.com/index.html
Which is an updated version based on the original game with new spiffy
graphics and such. I tried unsuccessfully to contact the authors...
i'm guessing it's philip and gary based on their email addresses:
price@aro.com and glg@aro.com
The project seems to be in a lull, as the web page hasn't changed in a
long time, and based on tidbits from people i've talked to on the net.

I'd appreciate any info! Thankx!

Ben Johnson
jbenjam@eas.purdue.edu

Hi all,

Just to let you know that at some time yesterday (Monday 8th March)
the Atari 8-bit Computer WebRing received its 10,000th hit! That's
10,000 clicks on the buttons (next, previous, etc.). Also on Sunday
7th March the WebRing received the most hits in a day - 513.

I'd like to send a big thank you to all those of you that have pages in the
WebRing and have made it a success. And here's to the next 10000
hits!

For those of you whose web pages aren't in the ring... What are you
waiting for? For those of you that don't know, a WebRing is a way of
connecting together web pages. In this case, all the pages in the
ring are about our beloved Atari 8-bits. For more information go to:

http://www.geocities.com/SiliconValley/Lakes/7953/a8ring.html

Anyone have any docs on setting up a hard drive on the ICD MIO?
Specifically setting up multiple partitions. I can get the first partition
formatted but HDFMTDIR will not recognize the second one - in fact nothing
recognizes it. I am using a Seagate ST251 40 meg - MIO setup is this:

1st partition: id:0 lun:0 6heads 820cyls startsec:1 endsec:
65536
2nd partition: id:0 lun:1 6 820 65537
131072
3rd partition: id:0 lun:2 6 820
131073 (i forget last sec)

My 10meg drive is beginning to byte the dust and I want to put a larger one
on.

Also...
Anyone have a schematic diagram for an ATR 8000?

At first, I was baffled too.
Then I started thinking. I have seen this happen several times
before, unfortunately. One person doing lots of work for a user
group. Maybe there are more folks working very hard in your user
groups, but especially the newsletter editor has to put a lot of time
into maintaining a constant flow of magazines and text.

>I'm a user group (Ol' Hackers) newsletter editor. If somebody is going to
>take over, they need training in the software and routines.
>If nobody is going to take over, that's one international 8-bit club
>that may need to reorganize or restructure the way
>that it gets info and programs to members.

I think it is wise and fair to give people a fixed time frame in which
to consider what they want to do. If you would have said this in
december, the club would probably cease to exist, as I have seen
many times in the past couple of years. So people, take notice,
this is for real! Take over, or quit along with Alan.
I have heard people begging newsletter editors and other officers
to go on, coming up with all sorts of ways to make the user group
survive, when in fact, at that point, the user group is virtually
non-existent anymore. So, to state this long before the final date
is just make people sit up and take notice. Come up with
alternatives or step forward and take over now, or be silent
and make the club bleed a slow and painful death.
Indeed I have seen officers be fed up with Atari stuff so much
at such a moment, that even though (or maybe just *because*)
they devoted a lot of their spare time to Atari and the Atari
community, that they really *do* leave it for good.

Somewhere in my heart I hope at some point in the next
century, you will still be able to enjoy some Atari stuff Alan.
So, take one XE, put it in a time vault, bury it in the yard,
make a map, put an X on it which marks the spot, and then,

in 40 years or so, when your mind reverts to childhood,
just before they take you to the old-folks home,
go out and I hope you will find the treasure.
Resistance is not futile.

Make those XL's/XE's hum in another 40 years!!
Ernest.

Ernest, thanks for the kind words. You percieved what I was trying to say. It will take time to get someone ready to take over my slot, assuming that someone will. If not, and the user group needs another way to distribute info, I'd like to be part of those discussions, too. If nobody wants to do anything, it's time for the club to fold.

I belong to another user group, too. It's a small one. Although nothing official has been discussed, several of us are beginning to dabble in Linux. Now, there's a growing interest. The group may survive if it changes its focus.

As of now, I'm not keeping any Atari equipment, but my son expressed an interest in having some of it. I'll know where to get it when that craving comes back!

Are these in the public domain? I'd sure like to get ahold of the whole forem series too...

I am bent and determined to set up the BBS that I never got to do in 1985, completely run only on equipment/software available in 1985. The disk I had from that time with Forem XE on it is missing a couple of files, and I've long since lost the disks with forem 1030 and forem XL on them.

Also related, does anybody have that 1030 mod for ring detect handy, or can you just explain how to do it? I assume that you have to do the same thing with the xm301, right?

Cheers,

Aaron

Source record: 54136

Your problem may lie within the sectors you have laid out. 1, 65535, 2 should be 131070, and up from that..reformat the drive won't take long remember the last sector you have on the screen when it is done and put that there in the third section as the last..1, 1-65535, 2 65536-131070, 3 131070-?? your last sector listed in the format plus 1.

2784. Re: BBS Software.

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-10 00:00:00 UTC
From: mark <webmaster@turborater.com>
Message-ID: <7c5pf1git1@nnrp02.primenet.com>
Source record: 54000

ring detector involved:

1 phone flasher from radio shack
1 joystick cable
1 2 prong cord with non plug end frayed.

the way mine was rigged, was as follows:

screw the two prongs on the phone flasher together and then splice the 'FIRE BUTTON' wires from the non-plug end of the joystick with the wires of the of the frayed power cable, plug this into the bottom of the phone flasher, and plug the phone cord to the phone flasher into a dual recepticle phone jack.. when the modem line rings, the ring voltage will pass through the phone flasher and press the FIRE BUTTON on the joystick, which on alot of Atari bbs's was the ANSWER method.

im not positive on which wires splice with which.. but i also doubt that the ring voltage would hurt your atari.. better safe than sorry tho, use a spare.

i would love to correspond more with you on Atari BBS stuff.. i ran one in the mid 80's until about 1988 when i moved it to my IBM.. i am still an ATARI BBS freak and like i said, i am collecting as much as i can.

talk to you soon,
mark

2785. Atari Color Monitor...which is BEST?

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-10 00:00:00 UTC
From: Bowling <mbowlin1@tampabay.rr.com>
Message-ID: <oNuF2.338$AT6.3900@newse2.tampabay.rr.com>
Source record: 54001

I found a terrific Atari color monitor (I'm not revealing the type just yet, because I don't want to influence responses to this newsgroup "post"). I know Atari didn't make very many different monitors, so I'd like opinions on which Atari color monitor is BEST for use as an "all-around" monitor for use with classic game systems (I'm NOT going to use it with an "ST", as Atari designed some monitors for).
Simply put, I guess I'm looking for a rough equivalent to a Commodore 1702, which is universally recognized as a terrific monitor for use with classic game systems. Which Atari-made monitor comes closest?

Uh, Mark? In asking about Atari-made monitors for classic gaming, you state that "I know Atari didn't make very many different monitors." In fact, Atari didn't market ANY monitors for the 8-bit computer line, which would be the type that you would need.

Now, having said that, Atari had one color monitor in development around the time of the launch of the XE computers. It was called the XC-1411. It was identical in appearance to the SC-1224 (Goldstar) monitors on the ST.

The XC-1411 never made it past the prototype stage. I am lucky enough to own one of the XC-1411 monitor prototypes. (In fact, I have a picture of it in the 8-bit vaporware section of my web site. Link provided below.)

The XC-1411 color monitor was a basic composite monitor. The screen quality is very good!!! My model says "SAMPLE" on the back. There is no serial number, model number, or any other markings on the back. There are two female RCA connectors for attaching the video cable.

My time has been non-existent for the past few months. Plus, it is relatively stable and functional with the current version, so I haven't felt overly motivated. There are a few nagging bugs to clear up, and beyond that I had given thought to a few major issues:

* Network connectivity. It is unlikely this would ever work anywhere but over a LAN. I can think of no way to implement it that wouldn't require ~20ms resolution on packet exchange, and that can simply never happen over the internet. Yes, I am aware other emulators have done it. Those systems didn't have the very high input frequency the Atari does for things like joystick control. Being painfully aware of Winsock and it's limitations, I have my doubts about this ever working.

* An APE/PRO interface, likely by requiring users to purchase APE as a DLL and tie it in to Atari800win. Very difficult on a variety of fronts. Alternately make my own APE/PRO type system.

* Rewrite the fundamental code base to be really object driven and heavily hardware abstracted, to make it portable to more modern language systems/platforms. This would break compatibility with the other Atari800 ports. However it would make a Mac version easy and potentially an (ultra-slow) Java version feasible.

* At one point I had about 70% of the CPU code written in hand assembly, but it all fell apart due to changes made by the rest of the team. Might revisit that some day.

* Single cycle CPU mode, which would require a high end Pentium or P2 system.

Anyway, at some point I will pick things up again.

-Rich

Thanks for the response...but you misunderstood the "preface" to my question (slightly). My statement was "I know Atari didn't make very many different monitors." My statement was NOT, "I know Atari didn't make very many different monitors for 8-bit computers." I KNOW (and knew) that Atari didn't release monitors specifically for the 8-bit line. However, you seem to assert that NO computer monitor designed to accompany a 16-bit (or greater) line of computers could possibly be utilized for an 8-bit gaming machine. I am under the impression (am I wrong?) that sometimes monitors can be made to function for computers outside their original product "line".

Source record: 54006

Hi, everybody,

I've always wondered exactly what Atari produced -- they had so many designs and some of them slipped through the cracks. Are there any authoritative internal Atari production documents out there? What I have in mind are lists of things like these:

- The model-numbering systems -- both old (as in 400, 410, 800, 130XE, 1040ST) and new (as in XF551, XC212). Those new part-number examples are supposed to exist but don't bother me if I goofed up... they're just to show the format of part numbers.

- ROM revisions of OSs, BASIC, disk drives

- Source listings (even for the latest revisions)

- Manuals and tech refs, schematics, etc.

- International versions of machines (that Arabic Atari mentioned here was pretty cool!)

- All the chips Atari ever designed

- Probably other things (use your imagination)

Does this kind of OFFICIAL information exist anywhere? Or was Atari just not that organized?

Thanks,

-- Derek

there should be a free key-remapping for atari-joysticks emulation. It's
almost impossible to play any games on my notebook, without having a
numpad/external keybord..

and yes, two joysticks via keyboard (for simultan interacting games (ie.
MULE))

Hi Sysops,

Please e-mail me, I want to connect the other side of the world again....
We have lost contact with lots of BBS systems overthere (USA/CANADA etc).
I am located in the Netherlands (EUROPE) and I want to network with all
active systems.
Please mail me and we can set-up a network again....

Our network at this point includes 3 running boards in the Netherlands, 2
boards in Germany and at least 1 board in the USA (*this connection has been
lost).

I am looking for the boards/network that is located in Sweden, Italy,
Canada,USA and other country's

PLEASE

Call +31-416-561927 300-19200 24hr/7days
-= The Underground Node #472 BBS =- Running BBS Express Pro! 5.0b

Or e-mail to: SysopTXG@underground.demon.nl

When you are running another BBS and/or network on the 8-bit ATARI please
mail me, because we can
look if we can connect it by writting some converter software....

BBS Express Pro! can export and import QWK files so that could be one
solution but maybe there are
some other possibility's too...

Gtx,
Sysop*TXG

Actually the "ring" voltage from the phone line (at least in the
United States) potentially could be very damaging to the Atari. The
ring voltage is aoproximately 90V!

So it is important to take care. Use a solid design and build it
correctly.

If I remember correctly from my dim-witted past, the Atari SC1435 (successor to the ST's SC1224) was a multi-sync monitor. If so, it probably could have been connected to a composite signal, maybe even split luma/chroma. I use a Commodore 1701 on my XE system, and I think it's great! I even hooked it up to my VCR once. Best picture I've ever seen that tape machine produce. I also have an Amdek Color-I Plus (composite only-no split video) which I don't think is nearly as good.

or here:

1982 Atari Logo Cube Notepad
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=76736681

This auction is a 3 day auction ending on Saturday 3-13-99. Bidding
starts at $0.01 and there is no reserve price.

This is a cube notepad with a full color Atari Logo printed on all four
sides. This was made in 1982. I have no idea how these were distributed,
but I would guess that they were used around the Atari offices.

Please email me if you have any questions.

Thanks,

Joe

> probably could have been connected to a composite signal, maybe even split
> luma/chroma.

Alas, although Atari's SC1435 was actually manufactured by Philips/Magnavox and based on their 1CM135, Atari apparently decided to shave a few pennies and the SC1435 does not have the composite or split video inputs of the Magnavox 1CM135.

Well, Alan's already heard my viewpoint after I saw this message on the Atari ST forem.

All and all, I think things do go in cycles. Alan mentioned that he's been at this for 17 years. That's actually about 9 years longer than my normal theory for a person being part of a club. I find that I am pretty happy being a part of a group for about 5-9 years before trying something else.

As for me, I was a part of the Atari scene from 1985-1989, and then thought that Atari was for the most part fading off, and bought a Macintosh.
In 1998 I find myself at a computer show and find a Atari group? That was strange. And ever since I dove back into the Atari world and had a blast. Got a Atari 800 in the living room for games and cataloging, and I'm trying to get a high end ST system running as a hobby machine.

Things go in cycles. Perhaps in a decade you two will find your way back. I know I've been amazed at what I've found in the Atari world since I've returned.

But until you go, I will be enjoying my Ole Hackers disk magazine! (Which I continue to show off at the monthly AUNT meetings).

Here's for fun until your departure, :)

Okay...here's my stupic question of the day. I bought several Atari carts. One of them had no label (a standard Atari "metal-topped" LEFT cartridge design). Outside it were scratched the letters "EDITE". I put the cart in and up comes a blue screen with the single word "EDIT". What do I have? A dead cart? Additional clues: Inside the cart is a green board with two black rectangular chips, one dated 1985 and one dated 1982. Also, on the back of the green board is labelled "CO12963 REV B", and also a copyright date of 82.
Any guesses?

Source record: 53945

Shortly after Xmas, I sent in the online order form for the downloadable version of the PC Xformer 98 from Emulators Inc. They billed my credit card later in January and I have heard nothing from them since. I have sent several emails and faxes, but nothing gets a response. I tried phoning - that's a joke. After listening to an interminable message, I was able to leave a message of my own.

Anyone else have problems with them?

Considering how much Atari activity is now in German :) I was curious
if any of you 8-bit users have a German instruction module for the Atari
400/800 that you wouldn't mind parting with.

Figure I can use my Atari 800 *AND* learn German. ;)

Doctor Clu

Mark--

type the word BUG and hit return...

if the new prompt is DEBUG, I would say you have some version of the
Atari Assembler/Editor Cartridge.

This is a great way to learn 6502 Assembly, if you're into that stuff :)
Of course for real programming, there are better Assemblers...

The same cable used for a C64 will work with an Atari.

Also, Radio Shack used to sell a DIN to RCA adapter which works quite
well. I'm certain a good electronics parts dealer would have something
similar. The video pin-out can be had from the manual that came with the
130XE, from Mapping The Atari and (I think) the FAQ.

As far as I know, Atari only made monitors for the ST (and maybe for
their very short-lived line of PC clones). If you have something else,
I'd like to hear about it.

Well, inspired by this question, I did the ClearPic upgrade to my 1200XL tonight. I only have one word for it: WOW! I've left this thing on a shelf since I got it because the video was so bad. But now it's sharp, clear, and has much richer color to boot. And this is all without using a monitor that has a chroma input, since my 1702 died. There's *barely* a noticable difference between it and my 800 now.

Anyone who has a 1200XL and hasn't done this should; it took me all of about 20 minutes from start to finish.

Now to add a PBI bus, multi-OS switch, and do a Bucholz 256 on it...

Aaron

Please direct all replies through E-Mail to bensmith@teleport.com or atari@benjamin.net instead of NewsGroups as I do not regularly read NewsGroups.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/ Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

None since Atari didn't sell any for the 8-bit. :)

I've tried just about every monitor imaginable since I buy them routinely
at thrift stores and such. The C1084 is good, but the best I have ever used
is my Magnavox RGB-80.

In addition to the picture quality it has up front controls, a green mode,
and RGB inputs. I have not tried it with an AMiga or Atari ST, but it
should work with the right cables.

This monitor with a Supervideo hacked 1200XL is a dream come true.

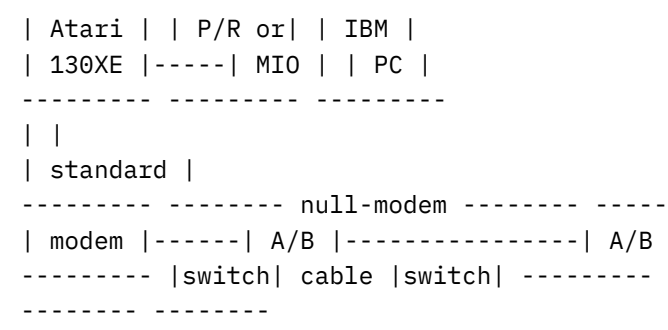
When I ran the Express! Pro BBS on my Atari I frequently moved files back and forth to the PC. For example, I had batch files that would ARC each directory on the Atari hard drives to a file with the same name as the directory. Then I'd connect to the PC and transfer the ARC files to the PC for backup. To restore the Atari hardrives, batch files would create the directories then un-arc the files (after receiving them back from the PC of course). But there were many other instances where I would transfer files between the computers. I used BOBTERM on the Atari and QMODEM on the PC. These were the best programs at the time for both platforms. There's no concern with the speed. Whatever the maximum for BOBTERM works flawlessly. I used a P/R Connection before I got the MIO, but either works fine. The A/B switches aren't necessary, but I soon tired of plugging/unpluging the modems to make direct connection. The A/B switches were a more elegant solution, and you can use off-the-shelf cables (the cable from the MIO to your modem (or A/B switch) is non-standard of course). I always get all my cables from Roger's Specialist located in Southern California. If you have two telephone lines, of course you don't need any of this, and I frequently dialed into my BBS where I could work from the BBS DOS-SHELL, upload/download etc. But modem to modem connection will be much slower, and ties up both of your phone lines.



P.S. I have tons of 8-bit Atari stuff, which could be for sale.

P.P.S. I don't know what the discussion is about Atari DOS 2.5 and 850 interfaces. I found that stuff all pretty useless. If you haven't already, get SpartaDOS and a P/R Connection, or better yet an MIO. The MIO gives you a nice RAM-DISK and a SCSI hard drive interface as well as the RS-232 and printer ports.

2831. Annoucement: The Atari Sierra 68000 Project

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-11 00:00:00 UTC
From: Curt Vendel <cvendel@worldnet.att.net>
Message-ID: <36E767E0.878C7E4F@worldnet.att.net>
Source record: 54025

Annoucement:

The Atari Historical Society is proud to annouce the first ever
publicly shown pictures of the 1983 Atari Sierra 68000 Project.
Atari's own secret in-house advanced computing system based on the
Motorola MC68000 cpu and utilitizing an advanced chipset called "Silver
& Gold".

http://www.atari-history.com

Please select Atari Computers from the Main Menu,
select Atari 16/32 Computers,
select Atari Sierra 68000 Project from that menu.

Comming in the following weeks will be additional photo's as well as the
first ever shown photo's of the long rumored Atari 1600XL system!!!

Curt Vendel
The Atari Historical Society

2832. Re: Atari Color Monitor...which is BEST?

Newsgroup: comp.sys.atari.8bit

I myself have an AMDEK Color 300. It has ntsc composite and split composite.
Sure makes 80 column readable when using the split chroma/luma mode. And
Man is it ever sharp.
WIth built a build in speaker and other features. I'm happy with it.

Bowling wrote in message ...

2835. Atari Writer cartridge HELP!!

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-11 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <36E78FDA.29B@geocities.com>
Source record: 54029

I'm using a Atari 800 with the Atari Writer cartridge. A great way to catalog all the AUNT newsletter archieves.

HOWEVER, the carriage return symbols after every line is starting to get on my nerves. Is there any way to make those invisible? (Like on other word processors)?

Thanks in advance,

Doctor Clu

> Commodore
Played it on an Atari 130XE and a Spectrum. The former had the best
sound/graphics (naturally) although in gameplay terms there wasn't much in
it.

A lot got lost along the way. ISTR a rumour that when they sold their VAX
that held all the 8bit schematics etc., they didn't back anything up so
that lot got lost. Apart from anything else, the company no longer exists
so where would this stuff be? Long since dumped in a skip. There is a lot
of stuff that escaped via employees and suchlike and a good chunk exists
on the Atari History Site that Curt vendel does.

Source record: 54032

Question...
Can the Basic Rev 'B' chip in a 600XL be pulled out and replaced with the Rev 'C' chip??? Is it a simple chip swap???

Thanks!

B'rgds,
Vinnie

I can't comment on the Atari monitor's since I've never used them... I do have a Commodore 1702 - I think it's great... I use it with my 400, 800's, and 600xl... I like even better, a Teknika MJ-10.... both of these have composite video, and seperate chroma/luma... I had a TV tech add a switch so I can go 'green screen'... it just cuts out the red and blue guns..... I cannot remember the model # of the other Commodore monitor... 1602? 1624? This one is excellent as well... it is also seperated.. and has stereo speakers... may also have other inputs.. I forgot...

Rich please when you have the time have a check on the F5 reset prob,
800A&B operating systems perform a coldstart regardless of the whether
the reset vectors have been set to force a warmstart (ie code rerun).

The XL side is perfect, if the games reset proof then F5 will warmstart
to the newly set vector.

Its hardly a huge prob but with the emu being so good its worth making
it damn near perfect :)

Personally I would not miss this item, its a neat perk but the emulation
comes first and foremost in my book.

>* An APE/PRO interface, likely by requiring users to purchase APE as a DLL and
>tie it in to Atari800win. Very difficult on a variety of fronts. Alternately
>make my own APE/PRO type system.

Hmm.....Again, emulation 1st for me..This feature would be really nice
and great for the real disk and hardware purists but I think the way the
emu works is more important.

Worth thinking about when you are thru with the compatibility side..
>
>* Rewrite the fundamental code base to be really object driven and heavily

>(ultra-slow) Java version feasible.

Surely a swings and roundabouts thing, 2 other platforms get a cracking
emu BUT the group thought on code goes a bit out the window and surely
the emulation suffers?
>

Yes, try the Super Video upgrade, but to
my eyes, even the SV upgrade does not
fully compare to the video of a stock 800
(at least from my machines). The XE is
the closest, but still not quite there. NTL,
I was amazed at the difference achieved just
by clipping out the one capacitor men-
tioned in the upgrade. WHY did Atari ever
add that???

Don't think that this can be done with a
stock 1050, since UTIL.EXE doesn't
support E/D. (?) Of course if you make/
buy a 1489 cable, then yes, it's easy. But
not with the hardware mentioned.

I've still got my cassette copy, although I no longer have the 410 or 1010 to load the thing (assuming the tape is still good to begin with, which I think it is). I don't currently have my 8-bit set up, but it's not a big deal to do it. Or, I suppose I could play the tape into Cubase Audio, and save the track as an .AIF or .WAV file, and someone could try to convert it to an ATR...

What do you think, is it worth the effort?

> The same cable used for a C64 will work with an Atari.

Not necessarily. While the 1701 was packaged with a 5-pin DIN to dual RCA cable that works fine with an Atari (for composite color use, not split video), the 1702 and later Commodore monitors were packaged with an 8-pin DIN cable that will not even fit into an Atari's monitor jack. (Commodore put the chroma on pin #6 of the DIN-8, so the 8-pin plug is required to access that signal for chroma/luma output).

> Also, Radio Shack used to sell a DIN to RCA adapter which works quite
> well. I'm certain a good electronics parts dealer would have something
> similar. The video pin-out can be had from the manual that came with the

I am not certain if Radio Shack still sells this, but there are mailorder dealers that do. I'll have to check my catalogs to see which dealer(s) had it, but I definitely remember seeing it recently.

Hi, I am looking to buy the following Atari games, they MUST BE COMPLETE and in excellent condition though!! Originals only. I can provide a list of the items that were included with the Infocoms if need be.

Infocoms Actually these do NOT have to be Atari, any computer platform would do if nice condition and complete.

Deadline
Enchanter
Infidel
Leather Goddesses Of Phobos
The Lurking Horror
Moonmist
Nord And Bert Couldn't Make Head Or Tail Of It
Seastalker
Sherlock
Sorcerer
Starcross
Suspended
The Witness
Zork II
Zork III
Zork Zero

Possibly some of the Ultimas if complete and nice too. Please contact me by email with any questions or offers.

Thanks,
Tom

To be honest, the only game I can think of that would benefit from network
play is a 4-player Asteroids "deathmatch" :)

> * An APE/PRO interface, likely by requiring users to purchase APE as a DLL and

I wouldn't mind seeing a APE interface for Windows, but the guy said that
with timing issues APE should only run on a clean DOS only setup. (No DOS
prompt) Also too bad 8-bit emulators in general can't use the PRO images for
running backups of disk games. Still, with a program like Chipmunk that's a
moot point.

> it all fell apart due to changes made by the rest of the team. Might revisit
> that some day.

I personally like to see more assembly optimization, but since this is a port
of Atari800 then portiblity is a must I suppose. Still each platform should
have it's own assembly core I think, the Falcon version definitly needs it.

> Anyway, at some point I will pick things up again.

Here's a few suggestions I have which probably won't be implemented but I'll say them anyway...

- Support for Diamond OS. Alan Reeve was kind enough to put the image of the cart version up, but it's much bigger than what emulators usually load. Plus it would be nice to use the PC mouse as an Atari mouse. That way the 8-bit emu can be used for product means instead of just gaming and programming. Not that there's anything worng with those of course... :)

- And paddle support, actually it doesn't really matter except for those few games like Breakout. A mouse would fit quite nicely though... ;)

BTW, how do I get the Hard Drive emulation to work? I remapped it to a folder and it only reads from a directory but I can't really open anything. Does it only work with MyDOS? (I have to get a another image since the one I had was corrupted)

4 Days left.

Boxed Atari 1027 letter quality printer, power supply, SIO cable, oil, extra print rolls (I don't know their condition) and owner's guide.

Also part of this auction, a boxed AtariWriter cartridge with owner's manual and quick reference card.

Additionally, APX Classics disk from Antic with Spell Magic, a spell checker compatible with AtariWriter.

You are right about the 1702 monitor's cable. It had more pins on it
and would not fit into the Atari XL monitor port. I received email
from a couple dealers telling me they had the cables so will probably
look there.

thanks

Hi out there, I have a Atari 800 set up in my living room that I use for games and right now I'd like to use for cataloging the Atari Users of North Texas archieves.

I was wondering if there is any way to make the highlighted carriage return characters invisible? I don't mind seeing carriage returns when I'm creating a document, but not when I'm trying to read it.

Any help will be appreciated!

Doctor Clu

Message-ID: <7ccq93bod1@mtinsc01.worldnet.att.net>
Source record: 53982

I want to thank the authors as well! I LOVE what you've done, and since pc's get faster every year, the code speed is just fine by me.. 2 years from now, we'll be running the same code at probably 4 times the original machine's speed!

And I do understand the problem with net connections.. I was just wishful thinking..

another "wishful thinking".. there were some programs that used the keyboard beeping.. is this emulated with winatari??

Also, hearing the disk drive load sound during a progam load would be nostalgic.. (just not the long load times.. LOL!!)

Latsly, adjusting the artifacting color intensity, and hues would be REALLY nice! I remember turning the adjustmentsto get a great red/blue on some games, and with the currnt setting we get a brown/blue combo.. surely making this adjustable, and creating a setting for this wouldn't be too hard??

(mainly I'd want color intensity, and a "tint" slider)

Beyond those minor things, I really can't think of anything else I'd change at all!!

Hi Roger.

You are not the only one who has had problems with Emulators Inc.
I got ripped for their Xformer95 program back in 1996. The company
is run by a man named Derek Mikhocka or something like that. I bought
a couple of Gemulator Atari ST emulators from them and even though I
received them, I was very unhappy with their performance.

Most games didn't run well, gave wrong colors, poor sound or
none at all, and no joystick support. And all of that topped off
by very poor customer support.

Don't bother with the Xformer98. If you want to try the BEST atari
8bit emulator around you must get "Atari800Win". You can get it from
here: http://www.cris.com/~Twist/atari800win/

I can't believe how well it works. It is the first and only emulator
that gave me true sound and colors for all my games. Even the
joystick support works flawless. And the best part is it is FREE!

VB

Try the Xformer98, then, get the Atari800Win program and try it too.
Compare both together ... the speed, colors, sound, DLI's, joystick
control, and window resizing. I'd be curious of your opinion.

I would like to have the settings saved in an INI file instead of the registry. I would then like to be able to specify an INI file on the command line. This would allow several configurations to be just a click away from the desktop. Anyone else find this useful?

I have downloaded the source and started moving the settings from the Registry to an INI file. Perhaps if this is useful to others Rich may incorporate this in to an official release.

True, but I've done my own work using the Inform compiler language (the freeware compiler on ftp.gmd.de/if-archive) to create Z-code games, compatible with Infocom's format, and it's possible to take most of those Z5 games and recompile them into Z3 games that could be played on 8-bits. In fact, Tom Hunt, who used to have the Closer To Home website until dyn.ml.org shut down (did he ever get it moved to a new location?) has already converted a few Z5 games down to Z3 using his own interpreter. I once asked him how he did it, but I don't think he was ready to give out that information. You can probably find his versions of Adventure, MiniZork, MST3K, Odieus, Paperchase, and Toyshop for the Atari 8's on other sites -- maybe on UMich, but I haven't checked lately.

Inform, by default, compiles to Z5 format, which allows for 256K games, while Z3 games can only be 128K. Most people don't bother to force compilation to Z3, although very few games actually exceed 128K. According to the Inform Designer's Manual, even Infocom's games rarely needed that much room (yep, I just checked my games and 19 of them are less than 128K -- Zork 1, 2 and 3 and Starcross are only 90K each!). Going through my freeware collection, I've got 56 newer games that could have been compiled in Z3, and only 15 others that needed the extra space of the Z5 format.

I'm pretty sure a stand-alone interpreter could be built like the other platforms use, although I would bet it would require a 130XE or at least a good memory upgrade. There's enough good Interactive Fiction being written today to keep us going on our Atari's for a long time, as long as there's an intelligent programmer out there to write us the interpreter (hint, hint).

Play On!
Steven

17:23:02 GMT tracker@misnet.com stated:

> You are right about the 1702 monitor's cable. It had more pins on it
> and would not fit into the Atari XL monitor port. I received email
> from a couple dealers telling me they had the cables so will probably
> look there.

BTW, while I did find a couple of mailorder electronics places that have
5-pin DIN to 4-RCA plug cables that will do the job, the problem is the
if you just want the cable and nothing else. One place has a $20 minimum
order, and with the other, ordering the cable alone would mean you wind
up paying more for shipping than the cable itself.

Still, if anyone is interested in those sources, let me know, and I will
pull out the catalogs again and post the info.

I still intend to do the mag.... maybe too much fun doing h/w things instead.

Once a year is a reasonable expectation, yes. You will have to make your own determination if it is time for a fork. Anyone who feels that they need a refund, please contact me here or at Atari Classics.

AC? I have not registered AC in any form, just Atari Classics and Atari Rulz!!, the parent.

I just took two weeks off of work and did only Atari stuff. Still not close to production - it is very difficult to size these projects.

Just as an alternative, for under $10 you could solder one up-- its pretty simple. I have a home-built composite and S-video cable that I made-- not because I'm any good at soldering... just because I'm cheap :)

For composite monitors, buy a 5 pin DIN, and an RCA patch cable from RadioShack. Cut the patch cable in two, and solder them to the composite and audio pins of the DIN (with proper grounds, of course) That's it.

echlo

i'd like to invite all of you to atari8-l mailing list.

it's probably the biggest atari 8 bit related mailing list in the world -
- connected bidirectionally to old list at MARIST, and gatewayed to the
FidoNet(tm) international ATARI8-L echo.

for now it has about a 100 subscribers, from all around the world. the list
is free from all the F/S messages, and other off-topic discussions, so
you can find there pure atari8 related stuff... all the messages comes right
to your email account, so there is no need to contact a newsserver, there
is no old-messages deleting, and so on... my wish is that every atari user
would be subscribed, so the atari community stay together and grow in
strenght.

if you maintain an atari8 related WWW site, please put some informations
about the list on it - i'll help others - not everyone has access to
usenet.

to subscribe, please send the message to majordomo@zwieracz.ideefixe.nom.pl
with the following line in the body (not the subject) of your message:

subscribe atari8-l

the language we use is, of course, english. the list is fast, reliable,
regularily maintained.

please, share this message with all people that are interested in atari8
topics you know, and help make this mailing list wide known.

>only-no split video) which I don't think is nearly as good.

Actually, the SC1435 was almost identical to the SC1224, but the screen was 14
inches, and it had stereo speakers built in, as it was designed for use with
the STE (which has stereo output). I've got one of these monitors packed away
with my STE. It's an RGB, not multi-sync. :^(

And I've got one of those Amdek Color-I monitors too. I painted it black.
Good picture but not the best.

That is good to hear.

: Once a year is a reasonable expectation, yes. You will have to make your own
: determination if it is time for a fork. Anyone who feels that they need a
: refund, please contact me here or at Atari Classics.

Well, I always hold out hope. However, after a year since the last issue,
I am sure you can understand why I would doubt there will ever be another
issue from AC.

: AC? I have not registered AC in any form, just Atari Classics and Atari
: Rulz!!, the parent.

I did not suggest that "AC" was a registered name. I just thought that it
was in poor taste to refer to their Magazine as "AC" when Atari Classics
had been calling itself that for quite some time. However, "Atari
Computing" is run by the ST only clowns at the Toronto Atari Federation,
so I am not surprised they would hijack the nick name. They pay lip
service to supporting the 8 bit Atari, but largely ignore it. Anyhow, it
is my own opinion.

: I just took two weeks off of work and did only Atari stuff. Still not close to
: production - it is very difficult to size these projects.

Please keep us informed as to when the issue will be ready. I will fire
out a personal cheque in US funds as soon as I hear the word.

Willy

2907. WTB: Foot Craz Activity Pad

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-14 00:00:00 UTC
From: Bowling <mbowlin1@tampabay.rr.com>
Message-ID: <eMVG2.4426$8L1.4737@newse2.tampabay.rr.com>
Source record: 53923

Hi,
I'd like to buy (or trade) for the Exus Foot Craz Activity Pad, which was a pack-in with the games Video Jogger and Video Reflex. I will only deal with the first person to contact me who owns one, so don't everybody flood me with offers to sell your Activity Pads, now!!!
By now, you have probably tired of the novelty of playing your Video Jogger and your Video Reflex games, so why not consider the Activity Pad for a profitable sale? Or an enjoyable trade, for something "fresh" to add to your collection??? I have some good stuff!! (along with dead Presidents, if you prefer!). Please e-mail me at mbowlin1@tampabay.rr.com with an asking price (or else contact me to arrange a trade -- I have some goooood stuff!)
Thanks,
Mark

I have never done this, because I have
gotten enough Rev. C Basic chips from
dead 65XE's and 130XE's, but I have
heard that one can physically adapt a
28 pin Eprom to a 24 pin Rom by using
a socket with various legs bent up,
jumpers, etc. This is on my "to do" list
of hacks to try sometime in a year or
two after I'm retired.

Hate to pile on, but seems like "real" mail order companies don't charge your account until product ships. If he charged your credit card in January, and gives you a product in March, well... that's pretty lame. Wonder if he reads the newsgroups? :)

Source record: 53928

Hello All--

I was playing some games on the old 400 tonight and ran across a title called "LIFESPAN", by Roklan. It seemed to be a 'concept' game, like EA's "WORMS".

I really liked what I saw-- even if I had no idea what was going on! It starts with a "birth spiral" , and went on through "childhood", etc. Anyone know where I could get docs for this? Any comments on the game are welcome. :)

Thank You,
Steve

I need to get my hands on C cross-compilers for the PC for as many 8-bit formats as I can. I want to write a game for several platforms. I'm having some problems getting the information from FAQs and my old links seem to be mostly out of date.

Anyone who can supply up-to-date addresses, please email them to me (I don't want to get the newsgroups all jammed up with such a commonly asked question - especially as I'm posting to so many at once) as I'd like to get this done during my Easter break.

Thanks,

Niall Tracey

Does anybody know a rarity guide or list for Atari 400/800/XL/XE disc
and tape (not cartridge) based software ?

Bye

Andre

2916. Re: NTSC & PAL Carts? What'll Work?

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-15 00:00:00 UTC
From: Graham C Thornton <graham.thornton@ln.ssw.abbott.com>
Message-ID: <7cjenv$b63@news.abbott.com>
Source record: 53840

The vast majority of carts work perfectly well on both NTSC and PAL systems, even
my "North American TV Only" Track & Field cart looks just the same on my PAL
Atari 800 as it does on my NTSC 1200XL.

Just a few PAL games use video timing techniques that cause problems on NTSC
systems, but since the Europeans never embraced the ROM cartridge format as
widely as the Americans, most of those games come on disk.

Either way, they can be played on an NTSC system by swapping the NTSC Antic
chip for a PAL version. It should be a straight swap. I have done this on
my
1200XL and have yet to find a game that won't work. The only problem is
that
now your computer is really an NTSC system with a 50Hz signal, instead of
the
usual 60Hz. Most TVs and monitors have no problem with this, but a few do,
including my Sony 14" colour I bought from Best Buy two years ago. My
ancient
10" TI color monitor has no problem with the signal.

Hope this helps

Graham

2918. Wizards Crown Help?

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-15 00:00:00 UTC
From: Keith Scroggins <kws@saltmine.radix.net>
Message-ID: <7cjn6dqhm1@news1.Radix.Net>
Source record: 53842

Anyone know where I could find a help file for Wizards Crown on the net?
I remember waaaaaaaayyyyyyyy back that Compuserve had a semi walk thru for
the game. I'd kinda like to finish the game since these days there seems
to be a giant lack of good old fashion RPGs.

Another question, did the sequal to Wizards Crown come to the 8-bit? I
seem to remember it was called Eternal Dagger and was far easier than
Wizards Crown (well not simple, but Wizards Crown is a nice challenge).

Thanks for the replies!

The "Supra" hard disk for the 8 bits, is now the "K Products" hard drive interface. I know that you had to have some eproms with the heads and cyls embedded into it. There was some custom software I believe for formatting. You may want to contact K products for documentation/software.

Or you can do like I did,.....use the Supra case and power supply/hard disk with an MIO or Black Box, and chuck the Interface. There is no RS232 on the unit anyhow. It seemed very awkward to me, and I never took the time to get it going, so I never saw it in action. Good Luck!

Bein' as how this is a bit technical, I may be barking up the wrong
Leylandii, but I'm in the middle of re-editing the documentation for a
text-files-on-disk reissue of Arnor's implementation of "C" for use on a CPC
or PCW.

When I've finished (next weekend on my current rate of progress), the
program and manual-on-disk will be available for a fiver.

Interested?

I have no problem playing most PAL games that I've come across
on my NTSC (american) atari 8-bit. You will probably need to hook
up to a tv or monitor that has a horizontal hold knob since the two
systems put out different numbers of horizontal lines, PAL games
will "jump" on american tvs unless you adjust the HH. Also, since
the color palettes are different, you will not experience the true
intended colors of the games, but it will be good enough!

Anyone that wants to trade backups of NTSC or PAL cassette
games for the Atari 8-bit, please get in touch.

Thanks,

Scott

Last-modified: February 13, 1999

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

2935. Re: Anyone ever play LIFESPAN?

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-15 00:00:00 UTC
From: "Stephen C. Johnson" <sjohnson@mitre.org>
Message-ID: <36ED13D1.CF742FB8@mitre.org>
Source record: 53936

Actually, LIFESPAN is different from Conway's LIFE. LIFESPAN definitely has more "game" elements to it, and is interactive. I wish I could describe it better, but this game is really different! For example... in the birth spiral portion, moving the joystick and pressing the trigger change the sounds and graphics elements on the screen. this segments transitions into the childhood portion, where you have to corral moving objects with small blocks.

Thanks for the input,
Steve

Hi,

I had found 2 extremely rare XL/XE tapes

1. Misja by Avalon ER excelent condition box&docs
2 Android by K-soft ER excelent condition box&docs

(both have already in my collection) so now for trade/sell
offer ...
or trade for:

another 2 ER XL/XE tape/carts at least good condition
or
more of R,U or C tapes/carts (just offer)
or
VIC-20 system
or
Atari VCS/2600/5400/7800 systems (any of them)

bye,
Dalee,

pelc.d@pg.com

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-16 00:00:00 UTC
From: af332@freenet.hamilton.on.ca
Message-ID: <7ckina$kv6$1@mohawk.hwcn.org>
Source record: 53862

spearsk@mc-mc.com wrote:
: You show me how to hook up a Bernoulli Box to my 800, and I'll buy them.

From my understanding, there are SCSI versions of the Bernoulli. I know that the Syquest is in use by some Atari users. I have a "Multi Disk 150" and would use these disks, but the Multidisk is read only for Bernoulli 44 disks, so they don't do me much good. I thought that someone with a SCSI Iomega Bernoulli 44 would want them.

BTW, the only way to hook up a hard disk system of any sort with the 800 is using a Corvus Hard Disk, go find one of those. Anyhow, I'll cut out the smart ass comments if you do, ok?

I am searching for a multiplayer Atari 800 game called Maze War. I have
been told (Thanks, Vidar!) that this game was not released commercially, but
was produced by A.N.A.L.O.G.
Although I am acquiring a copy of this game (Thanks again, Vidar!), I am
wondering if anyone else has some familiarity and information on this game?
Can you confirm it came from A.N.A.L.O.G.? Have you played it? Was it ever
commercially released on a disk? If so, do you now own a copy? What
programmer(s) wrote it? Does it suck?
Any additional information is appreciated...

thats strange I was so sure they had the same pin outs and were swapable
that I took the rev B outta an 800XL and placed it in a 130XE and it worked
also then just to be sure I put the C in a 600XL and Put a Single Chip A in
the 800XL with no problems.
the only thing i can think of is atari got a deal on cheap Basic C Roms in
the later 130XE's and 65XE's and they have the same pins but not the same
pinout.....
can anyone verify this
thanks Ed

I've been looking for any kind of a driver that supported the
Indus Synchromesh high speed transfer for many years. The GTSYNC and
GTSYNC II utilities work only with DOS XL. I know that the SpartaDos X
cartridge supports it, but I'd really like something that works with the
disk based versions of SpartaDos. Ideally, it would also support the
optional 64K RAM buffer in the Indus. I'd live with MYDOS 4.5 if it would
support Synchromesh!

I was only being somewhat smart-assed in my reply. (half-assed?) I really would like to know of a way to hook up a SCSI drive to an 800. I know of the MIO, Black Box, and Supra-drive, but I thought they required an XL/XE parallel bus. And are they SCSI? I thought they were IDE. It seems possible, although not likely, that someone could've devised a way of using the 800 RAM/ROM slots to interface a HD. I can't see ANY way of doing it through the SIO. (well, except SIO2PC)

That helps. I myself would probably pay around $500 for a 1450XLD, but not a 1400XL. Looks too much like a 1200 :)

It is indeed an ANALOG release. I believe I have an ATR full of ANALOG games; if anyone is interested I can email it. It supports 4 players on a 400/800. It doesn't suck - in fact, it can be fun with multiple players, or even just competing with the zombies

If you want more information, take a look at
http://www.xs4all.nl/~stack/

or look in the deja news archives, or send me an E-mail,
I will be happy to answer all your questions.
Basically, it is a Double CD-rom in ISO9660 format.
One of them full of PD/freeware/shareware stuff
in ATR format, and one CD with pictures, internet
pages and various PC and other utilities.

Source record: 53788
Cross-posted to: alt.atari.2600,rec.games.video.classic,comp.sys.atari.8bit,rec.games.video.atari,alt.atari.2600.vcs

I have a Colecovision unit (working) Dust cover, two working joysticks (white ones brand new from coleco (said so on the box they came in)) and 14 games for trade.

The games are:

BC Quest for Tires
Squish 'em (R)
Mr. Do
Looping
Cosmic Avenger
Pepper II
Illusions (ER)
Wargames
Space Fury
Venture
Space Panic
Carnival
LadyBug
Donkey Kong

I'll also throw in another Colecovision (sound not working) and two non-working controllers.

What do I want? I'm looking for Atari 2600 games (R or ER) not on my list at:

http://pilot.msu.edu/user/reicher6/2600.txt

I'm especially trying to complete my Atari games collection

2970. SIO pins

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-17 00:00:00 UTC
From: Thomas RACHEL <Thomas.Rachel@gmx.de>
Message-ID: <7d096fhoh1@hades.rz.uni-sb.de>
Source record: 53793

Can someone tell me the usage of the pins on the SIO bus ? I just have a SIO2PC interface and want to add an interface to be able to load from my tape deck instead of te ATARI cassette player. So I need the pins for motor and audio.

BTW: Is it right that the ATARI and not the cassette player analyzes the audio signals from the cassette ? (If not, I won't do it.)

Thoma$

2971. 1050 drive head doesn't move.

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-17 00:00:00 UTC
From: bmw3@cec.wustl.edu
Message-ID: <7cne5fllc1@nnrp1.dejanews.com>
Source record: 53881

I have an Atari 1050 floppy drive whose head doesn't move when the computer tries to access the disk.

Here is what I've found out so far.

-The spindle belt is solidly attached. -The spindle motor spins at power-up. -At power-up, the head inches forward a bit and then back (not the full travel). -The drive selector switches are both pushed to the left (when viewed from the rear). -If I displace the head from its parking position (while the drive is off), it will move back at power up. -The access light stays on for about 1 sec after power-up. -The access light stays on for about 10 sec after inserting a disk. -The access light comes on when I try to boot the computer from the floppy, but the drive head doesn't move a bit (and I get "BOOT ERROR"). -The small felt pad on the plastic arm above the head is there.

The drive stopped functioning about 5-6 years ago (I don't remember the circumstances), and it has been in its box since then. I've tried resocketing all the IC's, but to no avail.

Since the head does move at power-up, does this narrow down the problem (i.e. SIO cable)?

Searching the Dejanews archive brought up a thread about a 1050 that had blown an RF choke inductor (component L6) and stopped moving its head as a result. The part labeled L6 on my drive does seem yellowish-brownish in the center (assuming it's supposed to be a single shade of green all along its length), but if it were actually blown, wouldn't that prevent the head from moving at all (i.e. at power-up and otherwise)?

Would anyone have any suggestions about where I should start looking?

Many Thanks
Benjamin West

I couldnt't even get the demo to run, even followed the instructions to the T. And I'm expected to pay $200 for something that I won't even know will work!? Trust me, a free copy of PacifiST and demo of TOS2WIN are the only good ST emus.

> Most games didn't run well, gave wrong colors, poor sound or
> none at all, and no joystick support. And all of that topped off

LOL!! When I played Donkey Kong on PC Xformer just to see how it works, I had to laugh. Bland colors, slow operation on a P2 of all things... It's only good with you need to transfer files from 1050 drive to ATR file. But then again there's APE and SIO2PC which are probably better.

> Don't bother with the Xformer98. If you want to try the BEST atari

'Nuff said...Atari800Win is the best.

I have to add one more thing. In spite of Darek's emulators and flippant attitude towards his customers, I only credit him with being the first to come out with 8-bit and ST emulators for the PC before anyone else did. From that came much better ones done by other people.

It's entirely possible to run a native compiler under emulation; that's
what I wrote zxcc <http://www.seasip.demon.co.uk/Cpm/software/linux.html>
for.

>Our good friend Mr. Watson's Arnor C is also a K&R compiler, although
>it has no floating point support.

zxcc was designed around Hi-Tech C, which is an ANSI compiler and has
rather inaccurate FP support.

If you have some time to invest, there exists excellent open-source compilers out there. For example, the SUIF compiler (http://suif.stanford.edu) is an excellent open-source optimizing compiler available for research/educational purposes. It provides a full-blown optimizing compiler from C to the SUIF intermediate language (all compilers use some form of intermediate representation, including gcc).

So all you'd have to do is write a back-end from SUIF to 6502, or any 8-bit processor you want to support, which is not that difficult. The advantage is you won't have to write all the optimizations routines, since they already exist. Also the SUIF compiler is very well documented.

2980. 2600 Diag.Cart, defacto ColorBarGenerator!

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-18 00:00:00 UTC
From: Bowling <mbowlin1@tampabay.rr.com>
Message-ID: <c08I2.3479$ht1.5126@newse2.tampabay.rr.com>
Source record: 53796

I was lucky to recently acquire -- in factory-sealed plastic -- the Atari 2600 Diagnostic Cart, along with accompanying joystick test plugs.
Happy to own an undeniably very rare cart, I at the same time longed for the Color Bar Generator, which has attained almost mythical status.
As I meticulously removed the Diag Cart from its factory-sealed plastic envelope, in the back of my head ruminated the thought, "Wouldn't it be great if Atari incorporated into this Diagnostic Cart a Color Bar test screen?"
Voilah!!! In addition to all its various test screen/displays, when I simultaneously placed both the difficulty switches on my 2600 to the "Expert" setting, there appeared a veritable spectrum of Colors, all arranged in horizontal (not vertical) uniform bars (18 in all) covering the spectrum of Atari 2600 graphical hues! A defacto Color Bar, from which one can tune one's television set to the appropriate shades of Atari-color!!!
Although treasured for its rareness, my not knowing if this cart would put on much of a "show" upon its insertion, dulled somewhat my satisfaction with this acquisition. But after reviewing all its test features (including the defacto Color Bars, AND an audible tone generator!), I am *quite* pleased with my acquisition :)

Find a power supply that works with the Atari 810, or 400, or 800, or 1050......they all work. You should be able to find one in a thrift for a buck or so. I have a ton, and could probably mail you one for $10US shipping included.

the 1200xl, like the 800, takes 9 volts ac. any 9 vac transformer
rated at 20 watts (15.3 amps) should work. you could probably find the
plug at radio shack. since it's ac, polarity doesn't matter.
the 810 disk drives take the same setup, but require about 43 watts.

Or write a back-end for GCC. There's already a 6809 one.

Hi Steven,

>Oh and don't forget, it may be the best $20 you ever spend :)

I can believe it, I grew up with my Atari 400 and later the 800XL so I have a real soft spot for Atari (still have my original 400 in fact, boxed and everything).

First real computer I had after battling with the limitations of my Sinclair ZX80 and 81.... :-(

I guess so. I think the 6809 version used a seperate assembler.

The last URL I have is:

http://www7.informatik.uni-erlangen.de/~msdoerfe/6809/

There was a new version released recently, I think I saw the announcement
on Freshmeat.

Min bid is $1, no reserve. For a picture or to bid, please follow this link:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=79228606

This auction includes an Atari 850 Interface Module with original power supply, serial cable, and Interface Module Operator's Manual. The Manual is an original, but is not bound anymore - there are wholes punched on the left binding, but it will be shipped loose. Also included is an 830 Modem with original power supply A-MP cable that I think goes with it (it fits).

Min bid is $1, no reserve. For a picture or to bid, please follow this link:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=79241823

This lot includes a bunch of Atari 8-Bit software, utilities and educational titles mostly. The following titles are all complete in the box:

SynCalc
SynFile+
Snooper Troops
Kids on Keys
Mickey in the Great Outdoors
Matchmaker
Magic Spells
Moptown Hotel
Success With Math: Addition and Subtraction
Success With Math: Multiplication and Division
Math Maze
Frenzy and Flip Flop
Snake-o-nyms and Word Flip
Mac/65
Action! (includes disk and cartridge)

Also included are the following programs (all original also): OSA+ with manual, Atariwriter Printer Drivers with Atariwriter manuals, Caverns of Mars, Home Filing Manager, Data Management System, Family Finances I, Family Finances II.

All software is original and on disk except for Action!.

3003. Tried to fix my 800XL...

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-19 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7ct1mo$esd@enews2.newsguy.com>
Source record: 53819

I was out and about checking out a couple of thrift stores the other day (for some classic video game carts etc.) and stumbled on the most beat up, dirty, left for dead 800XL I'd ever seen. The crud on this thing turned the once cream colored case top to a dingy yellowish brown. Nasty stuff!

It was all by itself, under some old china plates. I asked the guy about it, and he said, "oh, you want the old Atari huh?". Then went on to explain how he didn't understand why it had "letters" (ie KEYS!) on it, and why anyone would want it etc. I didn't even bother to attempt an explanation. Anyway, he wanted $15, but I talked him down to $5 since it looked beyond dead, and had no power supply - or anything else for that matter!

And even though I already have 2 working 800XLs at home, I wanted to get this one to part out in an attempt to fix my original (bought in 1984) 800XL that's had green screen disease since about 1986. So, I brought the poor neglected XL home, and I figured I might as well plug it in and power it up just to see if there was any life left inside, though I seriously doubted the power LED would even work. Well what do you know, it fired right up and passed all the self tests! Amazing! But, I did buy it for parts [I told myself], and it's sort of a weird sentimental reason I have for wanting to fix my original 800XL (don't ask!) so I began the procedure.

I opened up my ORIGINAL 800XL - something which I've done before to transplant it's keyboard into one of my other 800XLs - and checked out the board, and didn't see any burned chips or anything bad. And I noted that all the chips were socketed. All good so far.

Then I opened up the dirty/thrifted 800XL, only to discover that (in addition to the fact that it apparently served as a home to a family of small spiders at one time) all of it's chips were SOLDERED into place! Oh man! There go my chip transplanting plans...

Well, still wanting my old friend [original 800XL] to live again, I decided to use it's clean case, and transfered the "guts" of the thrifted XL into it.

So now, my original 800XL lives on in 2 separate 800XLs - one has it's keyboard, the other has it's case. And old original will sit idle again, in a nasty stained case until I can find another XL that has socketed chips. Then perhaps my old firend will come to life again, with fond memories of late nights fighting evil in EXODUS: Ultima III...

:^)

I just picked up a second 800XL. My first one starts up in BASIC, but this one comes up to a screen that says "The XL Boss V1.0". What is that? I can type text to the screen, but that seems to be it. I have a BASIC cartridge, which does bring the 800XL up in BASIC.

Hehe. Yeah I checked it out. "RARE" hehehe. I also decided to look
at his other auctions to see if they were funny too, and yep, they
were! Everything is RARE. Funny he's getting such lame bids then.

Hehehe.

Yes, this is a common complaint in many of the newsgroups that have collectors of one sort or another. Auctions of any sort are very much a "caveat emptor" situation. You have to know what you're looking for and not rely on the sellers' assessment of value or rarity.

Does anyone know how to get zombies from the Games005.atr working on the XL-it emulator? Whenever I try it it loads for a while, a few characters flash on the screen then it goes to the blue screen and stops loading. I've tried loading it in basic with the same results. Anyone know if you can get zombies working with the XL-it emuluator? What about with the Pokey emulator? What about a zombies atr that isn't part of a megaatr (and where could I find one?) Anyway thanks for the help. I told my older brother I'd help him get it working. BTW Joust on games001 also doesn't work, so if you have any idea on that...

Hello there,

I have my last copy of Atari 8 bit Rescue on Fractalus for auction on Ebay.
The cartridge is still in it's original, sealed package:

The address is:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=78902701

Thanks,

Richard.

3016. atari 410 tape drive problem

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-20 00:00:00 UTC
From: Robert Collet <Collet@worldnet.att.net>
Message-ID: <7cur71$4hu@bgtnsc01.worldnet.att.net>
Source record: 53828

I found an atari 410 tape drive a couple days ago, but I dont have a working 8 bit computer to use it on, so I cant test it out. However, when I plug it in it can rewind and fast forward, but the play button doesnt do anything. Anyway, is there any way to fix this? If you can fix it, I'd be willing to trade it for something, especially anything for the Mattel Aquarius. Thanks.

>
>---Keith

Wizards Crown is one of my favorite Atari 8-bit RPGs.
Alternate Reality (The City) and (The Dungeon)
are my all time favorites. Finished The Dungeon and
I believe I finished The City too. Hard to tell with
that one, not sure if there was a ending with The City.
There is a ending to The Dungeon.

I completed Wizards Crown some years back and still have several
pages of notes that I made while playing it.

If you have any specific question(s) about something in the game,
then I may be able to help.

Yes, Eternal Dagger did make it to the Atari 8-bits.
I got about half way through the game years back and
didn't finish it for some reason. Maybe someday I'll
pickup where I left off. ;)

I remember having a very hard time finding Eternal Dagger
for sale.

3018. NES cart "fix" Question...?

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-20 00:00:00 UTC
From: Bowling <mbowlin1@tampabay.rr.com>
Message-ID: <w4DI2.1047$rE6.419@newse2.tampabay.rr.com>
Source record: 53830

I have a copy of Caveman Games that always gives me vertical stripes
(grey/white narrow stripes, extending uniformly all across the screen). The
game plays normally, just the stripes screw up the enjoyment. No amount of
cleaning seems to fix the problem -- I have cleaned several times.
Is my cart ruined permanently? Or, does anyone know of a "fix"? Have you
had similar problems, and fixed them?

Ahh...let me inform you. I have schematics for the ATR8000. But just the ATR. I don't have any for the hard drive interface, Co-power 88, or the Co-power daughter board. But I will have some searching to do.

The 'play' function wont work until the Atari asserts the 'motor control'
line. In other words it will never play until an Atari computer
tells it to.

3025. Multi-character RPG on Atari 8bit?

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-20 00:00:00 UTC
From: X_velcro_X@netunlimited.net
Message-ID: <921951989mnewsX_velcro_X@netunlimited.net>
Source record: 53837

I know Alternate Reality set the standard, however you could only have one player. C-64 had a Bard's Tale version where you had your team of characters wage dramatic hit points battles with armies of enemies.

Were there any multi-character RPG's for Atari? Was Eternal Dagger one, and how deep is the play value?

Also Zork Zero... didn't that come out with some unusual elements on 8bit?

vs

To email me just remove the X's and underline marks from my address.

>megaatr (and where could I find one?) Anyway thanks for the help. I told
>my older brother I'd help him get it working. BTW Joust on games001 also
>doesn't work, so if you have any idea on that...

You have 2 problems, 1 you are using XL-it and 2 Zombies isn't worth
trying.

Xl-it was a very good emu in its day but is now way behind the likes of
Atari800win or A800DOS so get either of those two from your local emu
site and enjoy. Personally I recommend the win version but either will
work superbly.

As for Zombies, well, get Realm of Impossibility as that's the full
version of Zombies. If you do get Zombies to work on that atr (sounded
like you were running with basic) you will see that there is only you in
the maze......Slightly tedious I think you will find :)

Have fun....

3035. Atari 8-bits & Millenium bug

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-21 00:00:00 UTC
From: rgorexxx@aol.com
Message-ID: <19990321103019.09104.00000031@ng67.aol.com>
Source record: 53751

Its my first post for a while, so please be
gentle if this has already been covered.

Does anybody know if, how, what, why,
where or when any of the Millenium Bug
issues will affect the Atari 8-bit machines.

My guess is they will work fine because
they have no internal track of the date or
time. Any opinions?

But what about the R-Time 8 cartridge,
SpartaDOS or the other programs that can
use these date functions?

DOS XE works when the date is set to 2000,
files are saved with 00 as the year. Is this
1900 or 2000? Perhaps it doesn't really matter
in this case?

Cross-posted to: rec.games.video.classic,rec.games.video.atari,comp.sys.atari.8bit

Does anyone sell a converter for the standard 9-pin 2600 compatible joystick to a modern PC joyport? I've seen some pages with schematics, but I'm looking for any company or person who sells a ready-made converter. I searched around but haven't found anything, although I seem to recall post(s) by someone who does. Any help appreciated.

Thanks!

> Any help appreciated.

I haven't seen anyone who does these ready made. I did one, but it
doesn't calibrate well on the PC(poor quality resistors, I think). I
bought a stand-up machine joystick from Happ Controls, along with
full-size arcade fire buttons/player select buttons, that I mounted in a
custom box. I made the adapter so I can use it with my 8-bits as well as
Atari800/MAME, etc.

Anyway, it is about the easiest thing in the world to make. Even if
you've never touched a soldering iron, you could probably use crimp
connectors or something to make one that works OK...

Aaron

3040. Re: 1MB Ram Upgrades

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-21 00:00:00 UTC
From: rwoolley@postoffice.pacbell.net
Message-ID: <36F5832F.E6A2BF0C@postoffice.pacbell.net>
Source record: 53756

You can't beat a 512Kx8 SRAM chip for memory upgrades.... You can put in a 512K memory (total - 576K) with just two chips and a modified PAL, the memory chip and an HC00. You can also add a Dallas 1210 and a battery for permanent storage. Makes a very nice package. You want to solder up all those chips?? Better to use a SIMM, even.

SRAM is $13, HC00 is $0.30, new PAL is $3,, piece of cake.

Bob
(not what you asked for, was it?? sorry)

> Ebay is really neat if you are inclined to
> look for old stuff (as I am). But the number
> of items listed as "RARE", "Ultra RARE",
> really twists my tail.

I've seen Star Raiders called "Rare." That's Star Raiders, NOT Star
Raiders II -- the Combat of the Atari 8-bit world. I've seen people
setting a $5 minimum bid on a Combat cart, by the way. *Combat!*

You want rare? Try *working* 5200 joysticks. :)

I have won legitimately *rare* items, though, such as a ColecoVision
Slurpy cart (for nearly 50 bucks). Real collectors aren't stupid; we
can separate the wheat from the chaff.

>I sometimes will send
> a question to a seller asking why they
> have listed something as RARE. Some of
> the answers are most interesting.

It's rare because I've never seen one before, see...

The problem is that with collectibles, "rare" is relative to the demand
for the item. If there are 1000 widgets in existence when a million
people would like to have them, the widget is rare. If there are only
100 widgets but only 10 people want them, the widget *isn't* rare in
the context of collectibles.

As a coin collector, I draw a parallel to a "common" ancient Greek coin
and a 1909-S VDB cent; the Greek coin probably has only 1/10 as many
examples available as the Lincoln cent, but can be found for under $50
while the cent sells for 10 times that amount or more.

The Atari 8-bit market is fairly small, so few items are "rare" in the
context of a small market. Offer a 1450XLD, on the other hand... :)

If I remember correctly, Vidtex had some special features like a
proprietary download protocol and the ability to view RLE pictures on
line. Vidtex programs for other computers, such as the IBM-PC, could view
GIFs online, but I don't think there was ever a terminal with that
ability on the Atari 8-bits.

>it.)

Although the Atari sends audio to the cassette, the cassette player decodes the signal before sending it back. In the early 1980s, Popular Electronics magazine published a circuit to decode the tape signal. I built one once and it worked, but once I got a disk drive I never went back to tape.

Source record: 53761

Hi Derek,

Although not quite "Official", but fairly close to being as deals are being worked out as I type, the Atari Historical Society is one of the best starting points to help assist any and all individuals looking to learn more about Atari and its history. We are currently working on a deal with Atari Games Corp to put on-line a technical library or all coin-op manuals from 1972-1982 and hopefully if successful, this Officially sanctioned database will grow to encompass all technical manuals of the coin-ops. As for the home video game consoles and computers we are currently talking with Hasbro at this time, no word as of yet. To quickly answer your question regarding how the numbering system when on the computers:

The Atari 400 was originally going to have 4K so it was designated 400, the 410 was designed to worked with the 400 (and also the 800) so it was numbered so. The Atari 800 was to originally have 8K and it got designated 800, all of the 800 periperhals were designated 810 (10 series for storage), the 820, 822 and 825 (20 series for printers) 830 and 835 (30 series for communication) the 40 series was not used, 850 (Expansion series).

The XL series stood for eXtended Line and started with the 1200 (400 + 800 = 1200), originally the 600XL was to be the 400 replacement (400 being 1/2 of 800, 600 being 1/2 of 1200) but came out later with the 800XL (the 800 replacement, but more like the 1200XL replacement since it was a flop). 1400XL was chosen since it added voice and internal modem, 1450XLD was chosen to designate 50 (XL 50 series for storage, others which were not released were the 1053 true Dual Density and 1055 3.5" disk drive {can be seen on www.atarihq.com}) and D for Disk Drive.

Other unreleased were the 1600XL (800XL plus 8088 processor for IBM compatibility) and the Atari 1650XLD with built in disk drive in an Atari 1450XLD case. The Atari 1850XL which was to be the Atari 68000 system utilizing the Amiga Chipset Atari financed in 1983 and Commodore snatched up during the changing of ownership of Atari from Warner Comm. to Tramiel Technologies Limited which was renamed Atari Corp.

So, hope this helps a little bit, take care...

3046. FS/T: Atari 8-bit computer items [03/22/1999]

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-22 00:00:00 UTC
From: VideoGameAdvantage@DittosRush.com
Message-ID: <36ffaa69.12095202@news.nls.net>
Source record: 53762

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 03/22/1999

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection list for this system is currently on-line!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

{1} = requires 32K.
{2} = requires 48K.
{3} = requires 48K and printer.

Used diskette(s), with box and manual:
$ 2.50 Home Filing Manager, The (Atari)
$ 2.50 Print Shop, The (Br0derbund) {3}

$ 2.50 SynFile+ (synapse) {2} -- also includes Reference Card
$ 2.50 Timewise (Atari) {1}
$ 2.50 Touchdown Football (Electronic Arts) {2}
$ 2.50 VisiCalc (VisiCorp) {1} -- also includes Pocket Reference
Guide -- $5 shipping, due to weight, counts as 1st item

Loose cartridges, no box or manual:
$ 3.00 3-D Tic-Tac-Toe
$ 3.00 Alphabet Zoo [Spinnaker] -- no label
$ 3.00 Atariwriter
$ 3.00 BASIC -- for use with Atari 400 and Atari 800
$ 2.50 Centipede
$ 3.00 Dig Dug
$ 3.00 E.T. Phone Home!
$ 3.00 Frogger [Parker Brothers]
$ 5.00 Gateway to Apshai [Epyx]
$ 1.25 Missile Command
$ 2.50 Pac-Man
$ 3.00 Qix
$ 1.25 Space Invaders
$ 2.50 Star Raiders
$ 2.50 Super Breakout

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 3.00 Atari 1050 Disk Drive Owner's Guide (8 pages).
$ 9.00 Atari 65XE Personal Computer Owner's Manual (126 pages).
$ 5.00 Atari 800XL Home Computer Owner's Guide (22 pages).
$ 5.00 Atari BASIC Reference Guide: For Experienced Programmers
(14 pages).
$ 7.00 Atari Disk Operating System Reference Manual: DOS 3
(100 pages).
$ 5.00 Atari Home Computers: The Next Generation catalog
(32 pages).

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive does not include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 4.00

*****

LOT #2

ATARI 1025 PRINTER, with built-in power cord, and manual.

This item has not been tested.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 9.00

*****

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

XL Boss was a replacement OS for the XLs. I think it provided 400/800 compatibility, but hosed the PBI.

Feel free to correct this; it's been quite some time since I worried about OSes.

This is a new one on me! or am i missing something here.
All 8bit software written for ntsc machines will work on PAL
computers. the same is true most of the time the other way round. the
only hurdal is if a programmer uses up all the time avilable for one
full screen scan on a PAL system, ie PAL machines have more time to
display one screen, so therefor more code can be run in that time.
take that to a ntsc system, and things loose sync at best or not work
at all at worst.

Source record: 53770

Hi all there,

first thanks to all who have helped me to solve my A800<->PC problems.
Now a new one:

I just want to be able to get my bootable tapes bootable from disk. I
have copied them to sector 4... , but it didn't work. How can I get it ?
Do I have to turn it into a binary file ?

And also, I would like to know the formats of

* a binary file (to be loaded from DOS with L)
* a boot file (to be loaded from cassette; the 1st sector of a disk also
has this format)
* a disk (I mean the file structure)
Here, I already know that Sect#360 is the directory, but then ?

And: Is there a difference between .OBJ and .COM ? e.g. by convention:
the one needs BASIC, the other doesn't want BASIC and must be loaded
with OPTION...

Thanks a lot in advance.

Actually the PAL Atari has a hardware modification to adjust for PAL
Colours.So the colours should be the same.And extra lines are put at the top
of the screen so that software will still have just 24 blank lines at the
top of the screen when used on NTSC Ataris.
(of course games can and WILL probably change that)

Actually the POKEY chip functions as a MODEM when using the tape drive.
Instead of using TTL voltage levels it sends two different tones for the
different bit states.(true and false)
That's how you can do DTMF tone dialing with the 1030 MODEM even though it
only supports pulse dialing.
(and the audio in of the SIO port takes the place of a MODEM speaker)

I suppose you don't have that magazine anymore do you?
I have spent a lot of time researching the tape stuff on the Atari.
Hope to release my cassette .cas file to wave file converter
program soon. I really hate tape drives, so that is probably
why everything related to tapes is interesting to me...

Another follow-up to my own message. One of the power supplies I found was indeed the correct one I needed for the 1200XL. But the other is just slightly different and I'm trying to figure out what it's for! I don't have the part number with me, but it's 9.5 V AC, something around 4 A, and has a slightly larger output jack (both outer and inner diameter) than the more standard version. Any ideas?

Yes. Start at www.cswnet.com/~nkennedy/ and click the Atari links to search for SIO2PC. Or, if you are not familiar to soldering and building circuits, go to www.atari-computer.de and search for the complete interface. You can get it for 50 DEM (about $30).

Rich,

Here is what I see with Y2K and 8bits.

Like you stated before, the computer doesn't really
have a actual clock chip inside. So it really doesn't
know or care what day/year/decade/millenium it is.

Now. When you boot up something like SpartaDos
which sets the time/day/month/year that's where
the date issue comes into play. I can't say for sure
what restrictions Spartados has on the year. But
whenever I use it, I never bother setting it. The DOS
defaults to 1985 for the year. The only problem that
creates for me is I won't know when I created that
partcular file. Oh well...

Now, this may be a issue with someone who might
still be operating a BBS or using some of the business

application software that was written years ago. Anything that may sort stuff by year.

As long as there are enough spare parts, your Atari should last you for many years to come. In my opinion, this whole Y2K issue, for the most part, is a big HOAX. Created by people who are seizing a opportunity to make some good money. That are some legitimate problems out there. But most of what the media keeps saying is their excuse for reporting something!! And for beauracrats to get some attention.

Let me get down of this box of Tide now....

It's at http://srch.outpost.com/search/proddesc.cfm?item=80535 but you'd
need a Macintosh with ADB port, not the newer Macintosh like iMac.

They are $49 each but I have not ordered one so I cannot vouch for their
service or product quality.

Worth a look at is:

http://www.von-bassewitz.de/uz/cc65

The group have taken the old CC65 for the Atari and rewritten
most of it but with libraries only for CBM machines (64 etc).

I've compiled it under the CYGWIN port of GCC under Windows
and I have started to form the beginnings of an Atari 8-bit library.

Unlike the original CC65 this version can't compile itself to run on
the intended platform, but who needs this these days.

Mark.

Current bid $24.50, no reserve. For a picture or to bid:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=80032923

Here is an instant library for the budding 8-Bit Atarian who wants to get the most out of his/her 400/800. This Lot includes 13 titles, with hundreds and hundreds of pages of great reference material. The books are as follows:

Atari BASIC, 332 pgs
Compute!'s Second Book of Atari, 250 pgs
Compute!'s Third Book of Atari, 308 pgs
Compute!'s First Book of Atari Graphics, 248 pgs
Compute!'s Second Book of Atari Graphics, 220 pgs
The Atari BASIC Source Book, 299 pgs
DOS XL, 156 pgs
Inside Atari DOS, 115 pages
Mapping the Atari, 199 pgs
Atari 400/800 Basic Reference Manual

The following are not bound. They have holes punched on the left margin for easy insertion into a binder, but are shipped loose:

Atari 400/800 Technical Reference Notes, 273 pages
Atari 400/800 Hardware Manual, about 100 pgs
Atari 400/800 Operating System Source Listing, about 140 pgs

Those people are a scam, there is no Console Cables. I wanted to use a N64 controller but I found out that the company isn't legit (I got a Gravis Xterminator so it's no biggie).

You're better off getting a cheap crappy PC game pad and soldering the wires on a DB9 port to "bridge" the game pad contacts. I seen the directions somewhere but can't remeber where...

Correct... this is something I am using for my "all system" universal
arcade console controller project. You can find these all over the
place for "FREE" when stores blow them out with 100% rebate offers. :-)

Message-ID: <922476165@stackbbs.xs4all.nl>
Source record: 53656

```
>410 tape drive without play
It'll probably just run fine, since the motor inside the tape-drive will
be turned on/off by a signal provided by the Atari computer itself...

You have to do both, pressing PLAY and LOADing on the Atari to let it run.
FF/REW does work without the LOAD commands, as long it is powered...

Sysop Fox-1
```

Gateway: THUNDERDOME, Atari 8-bit BBS. Running on ATARI 130XE. (Pro-node 471)

3091. SIO pins

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-24 00:00:00 UTC

Message-ID: <922476166@stackbbs.xs4all.nl>
Source record: 53657

>using tapedeck on Atari 8-bit
An ordinary "music" tapedeck will not work on an Atari XL/XE without an interface, cause the Atari-recorder converts the audio-waves to digital blocks before the signal reaches the Atari itself...

You'll need to add an FSK decoder to make it work, but if you already have an SIO2PC set-up, and the possibility to make WAVe-files from Atari-cassette's, you may want to try the WAV2CAS utils from Ernest Schreurs. It converts the sampled audio to an .CAS image, which can be booted or loaded with the APE software also. Works great! Exactly the same effect as you would load a program from a real Atari-tape!

Sysop Fox-1

Gateway: THUNDERDOME, Atari 8-bit BBS. Running on ATARI 130XE. (Pro-node 471)

3092. ATARI BBS

Newsgroup: comp.sys.atari.8bit
Date: 1999-03-24 00:00:00 UTC

Message-ID: <922476167@stackbbs.xs4all.nl>
Source record: 53658

For those who're interested...

THUNDERDOME is an ATARI 8-Bit BBS in the Netherlands, running on Atari
8-bit ofcourse.

Call to get an impression of how real BBS' are working. Just logon with a
terminal, use ATASCII for the best and fasted results, but ANSI, VT, or
plain ASCII is also supported, all in both 40 and 80 columns...

Several Dutch, German, and English based networked mail online, and lots
of files to download, which can be downloaded when being registrated,
which is FREE of course!

You only pay for the phone-calls...

online: 21:00 => 08:00 hrs CET

Phone: +31 416 279990

or inside the Netherlands
0416-279990

Remember: People not interested in ATARI XL/XE will only waste time and
money. The only non-Atari platform programs you'll find on the board are
some Atari computer-, or Atari peripheral emulators!

Call one of those zillion other boards if you're searching for Duke Nuke'm
5D, version 3453.45, or Internet Explosion Beta 31.3f, cause you'll not
find those over here!

Well'll meet, on 19K2 or less...

Sysop Fox-1 (fox-1 AT aq DOT nl)
